# 1 Introduction

The Moxa UC-7112-LX Plus is a RISC-based ready-to-run computer that has two 10/100 Mbps Ethernet ports, an internal SD socket, two RS-232/422/485 serial ports, and pre-installed Linux operating system that uses MMU technology for more efficient operation. The UC-7112-LX Plus offers high performance communication and unlimited storage in a super compact, palm-size ARM9 box. The UC-7112-LX Plus is the right solution for embedded applications that require a large amount of memory, but that must be housed in a small space without sacrificing performance.

The following topics are covered in this chapter:

- □ Overview
- **Given Software Architecture** 
  - Journaling Flash File System (JFFS2)
  - Software Package

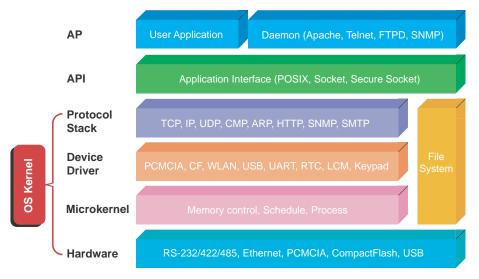

# Overview

The UC-7112-LX Plus uses a Moxa ART ARM9 192 Mhz RISC CPU. Unlike the X86 CPU, which uses a CISC design, the RISC architecture and modern semiconductor technology provide these embedded computers with a powerful computing engine and communication functions, but without generating a lot of heat. A 16 MB NOR Flash ROM and on-board 32 MB SDRAM give you enough memory to install your application software directly on the embedded computer. In addition, dual LAN ports are built right into the RISC CPU. This network capability, in combination with the ability to control serial devices, makes the UC-7112-LX Plus ideal as a communication platform for data acquisition and industrial control applications.

The pre-installed Linux operating system (OS) provides an open software operating system for your software program development. The UC-7112-LX Plus uses Linux kernel version 2.6 with MMU support (Memory Management Unit). Software written for desktop PCs can be easily ported to the computer with a GNU cross compiler, without needing to modify the source code. The OS, device drivers (e.g., serial and buzzer control), and your own applications, can all be stored in the NOR Flash memory.

# Software Architecture

The Linux operating system that is pre-installed in the UC-7112-LX Plus follows the standard Linux architecture, making it easy to accept programs that follow the POSIX standard. Program porting is done with the GNU Tool Chain provided by Moxa. In addition to Standard POSIX APIs, device drivers for the SD control buzzers, Network controls, and UART are also included in the Linux OS.

The UC-7112-LX Plus's built-in Flash ROM is partitioned into **Boot Loader**, **Linux Kernel**, **Root File System**, and **User directory** partitions.

In order to prevent user applications from crashing the Root File System, the UC-7112-LX Plus uses a specially designed **Root File System with Protected Configuration** for emergency use. This **Root File System** comes with serial and Ethernet communication capability for users to load the **Factory Default Image** file. The user directory saves the user's settings and application.

To improve system reliability, the UC-7112-LX Plus has a built-in mechanism that prevents the system from crashing. When the Linux kernel boots up, the kernel will mount the root file system for read only, and then enable services and daemons. At the same time, the kernel will start searching for system configuration parameters with *rc* or *inittab*.

Normally, the kernel uses the Root File System to boot up the system. The Root File System is protected, and cannot be changed by the user. This type of setup creates a "safe" zone.

For more information about the memory map and programming, refer to Chapter 6, *Programmer's Guide*.

## Journaling Flash File System (JFFS2)

The Root File System and User directory in the flash memory is formatted with the **Journaling Flash File System (JFFS2)**. The formatting process places a compressed file system in the flash memory. This operation is transparent to the user.

The Journaling Flash File System (JFFS2), which was developed by Axis Communications in Sweden, puts a file system directly on the flash, instead of emulating a block device. It is designed for use on flash-ROM chips and recognizes the special write requirements of a flash-ROM chip. JFFS2 implements wear-leveling to extend the life of the flash disk, and stores the flash directory structure in the RAM. A log-structured file system is maintained at all times. The system is always consistent, even if it encounters crashes or improper power-downs, and does not require *fsck* (file system check) on boot-up.

JFFS2 is the newest version of JFFS. It provides improved wear-leveling and garbage-collection performance, improved RAM footprint and response to system-memory pressure, improved concurrency and support for suspending flash erases, marking of bad sectors with continued use of the remaining good sectors (enhancing the write-life of the devices), native data compression inside the file system design, and support for hard links.

The key features of JFFS2 are:

- Targets the Flash ROM directly
- Robustness
- Consistency across power failures
- No integrity scan (fsck) is required at boot time after normal or abnormal shutdown
- Explicit wear leveling
- Transparent compression

Although JFFS2 is a journaling file system, this does not preclude the loss of data. The file system will remain in a consistent state across power failures and will always be mountable. However, if the board is powered down during a write then the incomplete write will be rolled back on the next boot, but writes that have already been completed will not be affected.

#### Additional information about JFFS2 is available at:

http://sources.redhat.com/jffs2/jffs2.pdf http://developer.axis.com/software/jffs/ http://www.linux-mtd.infradead.org/

# Software Package

Boot Loader	Moxa Boot Loader (v1.2)		
Kernel	Linux 2.6.9		
Protocol Stack	ARP, PPP, CHAP, PAP, IPv4, ICMP, TCP, UDP, DHCP, FTP, SNMP		
	V1/V3, HTTP, NTP, NFS, SMTP, SSH 1.0/2.0, SSL, Telnet, PPPoE,		
	OpenVPN		
File System	JFFS2, NFS, Ext2, Ext3, VFAT/FAT		
OS shell command	Bash		
Busybox	Linux normal command utility collection		
Utilities			
tinylogin	login and user manager utility		
telnet	telnet client program		
ftp	FTP client program		
smtpclient	email utility		
scp	Secure file transfer Client Program		
Daemons			
pppd	dial in/out over serial port daemon		
snmpd	snmpd agent daemon		
telnetd	telnet server daemon		
inetd	TCP server manager program		
ftpd	ftp server daemon		
apache	web server daemon		
sshd	secure shell server		
openvpn	virtual private network		
openssl	open SSL		
Linux Tool Chain			
Gcc (V3.3.2)	C/C++ PC Cross Compiler		
GDB (V5.3)	Source Level Debug Server		
Glibc (V2.2.5)	POSIX standard C library		

# 2 Getting Started

In this chapter, we explain how to connect the UC-7112-LX Plus, how to turn on the power, how to get started programming, and how to use the UC-7112-LX Plus's other functions.

The following topics are covered in this chapter:

- Devering on the UC-7112-LX Plus
- **Connecting the UC-7112-LX Plus to a PC** 
  - Serial Console
  - ➢ Telnet Console
  - > SSH Console
- **Configuring the Ethernet Interface** 
  - Modifying Network Settings with the Serial Console
  - Modifying Network Settings over the Network
- □ Installing a Secure Digital (SD) Memory Card
- □ Test Program—Developing Hello.c
  - Installing the Tool Chain (Linux)
  - Checking the Flash Memory Space
  - ➢ Compiling Hello.c
  - > Uploading and Running the "Hello" Program

#### **Developing Your First Application**

- Testing Environment
- ➢ Compiling tcps2.c
- Uploading and Running the "tcps2-release" Program
- Summary of Testing Procedure

# Powering on the UC-7112-LX Plus

Connect the SG wire to the shielded contact located on the terminal block in the left corner of the UC-7112-LX Plus, and then power on the computer by connecting it to the power adaptor. It takes about 30 to 60 seconds for the system to boot up. Once the system is ready, the Ready LED will light up.

**NOTE** After connecting the UC-7112-LX Plus to the power supply, it will take about 30 to 60 seconds for the operating system to boot up. The green Ready LED will not turn on until the operating system is ready.

# ATTENTION

This product is intended to be supplied by a Listed Power Unit with output marked "LPS" and rated for 12-48 VDC, 340 mA (minimum requirements).

# Connecting the UC-7112-LX Plus to a PC

There are two ways to connect the UC-7112-LX Plus to a PC: (1) through the serial console, and (2) by Telnet over the network.

## Serial Console

The serial console gives users a convenient way of connecting to the UC-7112-LX Plus. This method is particularly useful when using the computer for the first time. The serial console is useful for connecting the UC-7112-LX Plus when you do not know either of the two IP addresses.

Baudrate	115200 bps
Parity	None
Data bits	8
Stop bit(s)	1
Flow Control	None
Terminal	VT100

Use the serial console port settings shown below.

The following window will open when a connection has been established.

🖥 PComm Terminal Emulator - COM1,115200,None,8,1,VT100	
Pro <u>f</u> ile <u>E</u> dit <u>P</u> ort Manager <u>W</u> indow <u>H</u> elp	
🗐 🖬 🛃 🔊 🔄 🐺 🔊 28	
COM1,115200,None,8,1,YT100	
714 root 428 S /sbin/getty 115200 ttyS1 715 root 628 R ps DTE root@Moxa:/# RTS Moxa login: root	
Password:

** ** * * ** *** ***	
For further information check:	
http://www.moxa.com/	
root@Moxa:~#	
State:OPEN CTS DSR RI DCD Got Break Signal	

Login: root Password: root

# **Telnet Console**

If you know at least one of the two IP addresses and netmasks, then you can use Telnet to connect to the UC-7112-LX Plus's console utility. The default IP address and netmask for each of the two ports are given below:

	<b>Default IP Address</b>	Netmask
LAN 1	192.168.3.127	255.255.255.0
LAN 2	192.168.4.127	255.255.255.0

Use a cross-over Ethernet cable to connect directly from your PC to the UC-7112-LX Plus. You should first modify your PC's IP address and netmask so that your PC is on the same subnet as one of the UC-7112-LX Plus's two LAN ports. For example, if you connect to LAN 1, you can set your PC's IP address to 192.168.3.126 and netmask to 255.255.255.0. If you connect to the LAN 2, you can set your PC's IP address to 192.168.4.126 and netmask to 255.255.255.0.

Use a straight-through Ethernet cable to connect to a hub or switch that is connected to your local LAN. The default IP addresses and netmasks are shown above. To log in, type the Login name and password as requested. The default values are both **root**:

#### Login: root Password: root **Telnet 192.168.27.139** - 🗆 🗙 oxa login: root assword: #### #### \*\*\*\*\* \*\*\*\*\*\*\*\* \*\*\*\*\*\* ## #### ### #### ### ### #### ### ## ### ### ### ### ## ### ### #### ## ### #### \* \*\* #### ### ### \*\*\* \*\* ## ## ### ## ## #1 #### ## ### ## ## ## ## ## ## ## # ## ## \*\*\*\*\*\* ### ## ## ## ### ## ## ### ### ### ### ## ### ## ### ## ## ## ### ## ## ## ## ### ## ## ## ### # ## # \*\*\*\*\* # ###### \*\*\*\*\*\*\* \*\*\*\*\*\* \*\*\*\*\* \*\*\*\*\*\*\*\* or further information check: ttp://www.moxa.com/ oot@Moxa:~#

You can proceed with configuring the network settings of the target computer when you reach the bash command shell. Configuration instructions are given in the next section.

## ATTENTION

#### Serial Console Reminder

Remember to choose VT100 as the terminal type. Use the cable CBL-4PINDB9F-100, which comes with the UC-7112-LX Plus, to connect to the serial console port.

#### Telnet Reminder

When connecting to the UC-7112-LX Plus over a LAN, you must configure your PC's Ethernet IP address to be on the same subnet as the UC-7112-LX Plus that you wish to contact. If you do not get connected on the first try, re-check the serial and IP settings, and then unplug and re-plug the power cord.

# SSH Console

The UC-7112-LX Plus supports an SSH Console to provide users with better security options.

#### Windows Users

Click on the link <u>http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html</u> to download PuTTY (free software) to set up an SSH console for the UC-7112-LX Plus in a Windows environment. The following figure shows a simple example of the configuration that is required.

😽 PuTTY Configura	tion		
Category:			
Session	~	Basic options for your PuTT	Y session

About		Open	Cancel

#### Linux Users

From a Linux machine, use the "ssh" command to access the UC-7112-LX Plus's console utility via SSH.

#ssh 192.168.3.127

Select yes to complete the connection.

```
[root@bee_notebook root]# ssh 192.168.3.127
The authenticity of host `192.168.3.127 (192.168.3.127)' can't be established.
RSA key fingerprint is 8b:ee:ff:84:41:25:fc:cd:2a:f2:92:8f:cb:1f:6b:2f.
Are you sure you want to continue connection (yes/no)? yes_
```

**NOTE** SSH provides better security compared to Telnet for accessing the UC-7112-LX Plus's console utility over the network.

# **Configuring the Ethernet Interface**

The network settings of the UC-7112-LX Plus can be modified with the serial console port, or online over the network.

#### Modifying Network Settings with the Serial Console

In this section, we use the serial console to configure the network settings of the target computer.

1. Follow the instructions given in a previous section to access the Console Utility of the target computer via the serial console port, and then type #cd /etc/network to change directories.

PComm Terminal Emulator - COM1,115200,None,8,1,VT100	
Profile <u>E</u> dit Port Manager <u>W</u> indow <u>H</u> elp	
COM1,115200.None 8 1 V T100	
root@Hoxa:/# cd /etc/network/	
DIK	-
State: OPEN CTS DSR RI DCD Got Break Signal	11.

2. Type **#vi interfaces** to edit the network configuration file with vi editor. You can configure the Ethernet ports of the UC-7112-LX Plus for **static** or **dynamic** (DHCP) IP addresses.

#### Static IP addresses

As shown in the table below, 4 network addresses must be modified: **address**, **network**, **netmask**, and **broadcast**. The default IP address for LAN1 is 192.168.3.127, with default netmask of 255.255.255.0.

#### **Dynamic IP addresses**

By default, the UC-7112-LX Plus is configured for "static" IP addresses. To configure one or both LAN ports to request an IP address dynamically, replace **static** with **dhcp** and then delete the address, network, netmask, and broadcast lines.

Default Setting for LAN1	Dynamic Setting using DHCP	
iface eth0 inet <b>static</b>	iface eth0 inet <b>dhcp</b>	
address 192.168.3.127		
network: 192.168.3.0		
netmask 255.255.255.0		
broadcast 192.168.3.255		

3. After the boot settings of the LAN interface have been modified, issue the following command to activate the LAN settings immediately:

#/etc/init.d/networking restart

**NOTE** After changing the IP settings, use the **networking restart** command to activate the new IP address.

## Modifying Network Settings over the Network

IP settings can be activated over the network, but the new settings will not be saved to the flash ROM without modifying the file /etc/network/interfaces.

For example, type the command **#ifconfig eth0 192.168.1.1** to change the IP address of LAN1 to 192.168.1.1.

```
root@Moxa:~# ifconfig eth0 192.168.27.125
root@Moxa:~#
```

# Installing a Secure Digital (SD) Memory Card

The UC-7112 and UC-7112 Plus have an internal SD socket for storage expansion. For the UC-7112, a Secure Digital (SD) memory card compliant with the SD 1.0 standard can be used to provide up to 1 GB of additional memory space. In addition, the UC-7112 Plus supports Secure Digital High Capacity (SDHC) memory cards that are compliant with the SD 2.0 standard, and can be used to provide up to 16 GB of additional memory space.

In this section, we explain how to install the SD card in the UC-7112-LX Plus.

The SD slot is located on the right side of the UC-7112 Plus enclosure. To install an SD card, you must first remove the upper enclosure of the UC-7112-LX Plus to access the slot, and then plug the SD card directly into the slot.

The SD card will be mounted at /mnt/sd. Detailed installation instructions are shown below:

Step 1: Loosen the screws on the sides of the UC-7112-LX Plus's outer casing.

Step 2: Remove the UC-7112-LX Plus's outer cover.

**Step 3:** The SD socket is located on the back of bottom board. Insert the SD memory card as shown in the figure.

**NOTE:** To remove the SD card from the slot, press the SD card in slightly with your finger, and then remove your finger to cause the card to spring out partially. You may now grasp the top of the card with two fingers and pull it out.

Before removing the SD card, remember to type / sync to ensure that your data has been written.

# Test Program—Developing Hello.c

In this section, we use the standard "Hello" programming example to illustrate how to develop a program for the UC-7112-LX Plus. In general, program development involves the following seven steps.

#### Step 1:

Connect the UC-7112-LX Plus to a Linux PC.

#### Step 2:

Install the Tool Chain (GNU Cross Compiler & glibc). **Step 3:** 

Set the cross compiler and glibc environment variables.

#### Step 4:

Code and compile the program.

#### Step 5:

Download the program to the UC-7112-LX Plus by FTP or NFS.

#### Step 6:

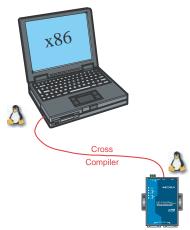

Debug the program

 $\rightarrow$  If bugs are found, return to Step 4.

 $\rightarrow$  If no bugs are found, continue with Step 7.

#### Step 7:

Back up the user directory (distribute the program to additional UC-7112-LX Plus units if needed).

# Installing the Tool Chain (Linux)

The Linux Operating System must be pre-installed in the PC before installing the UC-7112-LX Plus GNU Tool Chain. Fedora core or compatible versions are recommended. The Tool Chain requires approximately 100 MB of hard disk space on your PC. The UC-7112-LX Plus Tool Chain software is located on the UC-7112-LX Plus CD. To install the Tool Chain, insert the CD into your PC and then issue the following commands:

#mount /dev/cdrom /mnt/cdrom
#sh /mnt/cdrom/tool-chain/uc-7112-LX\_plus/linux/install.sh

The Tool Chain will be installed automatically on your Linux PC within a few minutes. Before compiling the program, be sure to set the following path first, since the Tool Chain files, including the compiler, link, library, and include files are located in this directory.

PATH=/usr/local/arm-linux/bin:\$PATH

Setting the path allows you to run the compiler from any directory.

## Checking the Flash Memory Space

If the flash memory is full, you will not be able to save data to the Flash ROM. Use the following command to calculate the amount of "Available" flash memory:

/>df -h

PC 🎦	omm Terminal Emulator -	COM1,115200,	None,8,1	<b>,</b> ¥T100			
Pro <u>f</u> ile	<u>E</u> dit <u>P</u> ort Manager <u>W</u> ind	ow <u>H</u> elp					
3	<b>B K B B B B</b>	Brk 38					
<b>5</b> c	COM1,115200,None,8,1,V	T100					
	/dev/mtdblock3	6.OM	488.0k	5.5M	8%	/home	~
	/dev/mtdblock3	6.OM	488.0k	5.5M	8%	/etc	
DTR	tmpfs	30.4M	0	30.4M	0%	/dev/shm	
RTS	root@Moxa:~# df -h						
	Filesystem	Size	Used	Available	Use%	Mounted on	
	/dev/mtdblock2	8.0M	6.0M	2.0M	75%	1	
	/dev/ram0	499.0k	16.0k	458.0k	3%	/var	
	/dev/mtdblock3	6.0M	488.0k	5.5M	8%	/tmp	
	/dev/mtdblock3	6.0M	488.0k	5.5M	8%	/home	
	/dev/mtdblock3	6.0M	488.Ok	5.5M	8%	/etc	_
	tmpfs	30.4M	0	30.4M	0%	/dev/shm	
	root@Moxa:~#						× 1
State:	OPEN CTS DSR RI DCD	Got Break Signal					

If there isn't enough "Available" space for your application, you will need to delete some existing files. To do this, connect your PC to the UC-7112-LX Plus with the console cable, and then use the console utility to delete the files from the UC-7112-LX Plus's flash memory. To check the amount of free space available, look at the directories in the read/write directory /dev/mtdblock3. Note that the directories /home and /etc are both mounted on the directory /dev/mtdblock3.

**NOTE** If the flash memory is full, you will need to free up some memory space before saving files to the Flash ROM.

#### Compiling Hello.c

The package CD contains several example programs. Here we use **Hello.c** as an example to show you how to compile and run your applications. Type the following commands from your PC to copy the files used for this example from the CD to your computer's hard drive:

# cd /tmp/
# mkdir example
# cp -r /mnt/cdrom/example/\* /tmp/example

To compile the program, go to the **Hello** subdirectory and issue the following commands:

#cd example/hello
#make

You should receive the following response:

[root@localhost hello]# make /usr/local/arm-linux/bin/arm-linux-gcc -o hello-release hello.c /usr/local/arm-linux/bin/arm-linux-strip -s hello-release /usr/local/arm-linux/bin/arm-linux-gcc -ggdb -o hello-debug hello.c [root@localhost hello]# \_

Next, execute make to generate hello-release and hello-debug, which are described below:

**hello-release**—an ARM platform execution file (created specifically to run on the UC-7112-LX Plus)

**hello-debug**—an ARM platform GDB debug server execution file (see Chapter 5 for details about the GDB debug tool).

**NOTE** Since Moxa's tool chain places a specially designed **Makefile** in the directory /**tmp/example**/UC-7112-LX\_Plus /**hello**, be sure to type the **#make** command from within that directory. This special Makefile uses the arm-linux-gcc compiler to compile the hello.c source code for the Moxa ART environment. If you type the **#make** command from within any other directory, Linux will use the x86 compiler (for example, cc or gcc).

## Uploading and Running the "Hello" Program

Use the following commands to upload hello-release to the UC-7112-LX Plus by FTP.

- 1. From the PC, type:
  - #ftp 192.168.3.127
- 2. Use the bin command to set the transfer mode to Binary mode, and then use the put command to initiate the file transfer:

ftp> bin
ftp> put hello-release

3. From the UC-7112-LX Plus, type:

```
# chmod +x hello-release
# ./hello-release
```

The word Hello will be printed on the screen.

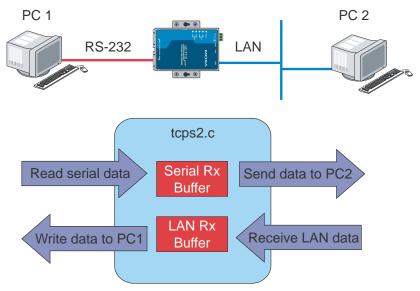

root@Moxa:~# ./hello-release Hello

# **Developing Your First Application**

We use the tcps2 example to illustrate how to build an application. The procedure outlined in the following subsections will show you how to build a TCP server program plus serial port communication that runs on the UC-7112-LX Plus.

#### **Testing Environment**

The tcps2 example demonstrates a simple application program that delivers transparent, bi-directional data transmission between the UC-7112-LX Plus's serial and Ethernet ports. As illustrated in the following figure, the purpose of this application is to transfer data between PC 1 and the UC-7112-LX Plus through an RS-232 connection. At the remote site, data can be transferred between the UC-7112-LX Plus's Ethernet port and PC 2 over an Ethernet connection.

# Compiling tcps2.c

The source code for the tcps2 example is located on the CD-ROM at

#### CD-ROM://example/UC-7112-LX\_Plus/TCPServer2/tcps2.c.

Use the following commands to copy the file to a specific directory on your PC. We use the directory **/home/UC-7112Plus/1st\_application**/. Note that you need to copy 3 files from the CD-ROM to the target directory: **Makefile**, **tcps2.c**, **tcpsp.c**.

#mount -t iso9660 /dev/cdrom /mnt/cdrom

```
#cp /mnt/cdrom/example/UC-7112-LX_Plus/TCPServer2/tcps2.c /home/UC-7112Plus/1st_application/tcps2.c
#cp /mnt/cdrom/example/UC-7112-LX_Plus/TCPServer2/tcpsp.c /home/UC-7112Plus/1st_application/tcpsp.c
#cp /mnt/cdrom/example/UC-7112-LX_Plus/TCPServer2/Makefile /home/UC-7112Plus/1st_application/Makefile
```

Type **#make** to compile the sample code:

You will get the following response, indicating that the example program was compiled successfully.

```
[root@server11 1st_application]# pwd
/home/UC7112LX plus/1st_application
[root@server11 1st_application]# 11
total 20
-rw-r-r-- 1 root root 514 Nov 27 11:52 Makefile
-rw-r-r-- 1 root root 4554 Nov 27 11:52 tcps2.c
-rw-r-r-- 1 root root 6164 Nov 27 11:55 tcps2.c
[root@server11 1st_application]# make_
/usr/local/arm-linux/bin/arm-linux-gcc -o tcps2-release tcps2.c
/usr/local/arm-linux/bin/arm-linux-strip -s tcps2-release
/usr/local/arm-linux/bin/arm-linux-gcc -o tcpsp-release tcpsp.c
/usr/local/arm-linux/bin/arm-linux-strip -s tcpsp-release
/usr/local/arm-linux/bin/arm-linux-gcc -ggdb -o tcps2-debug tcps2.c
/usr/local/arm-linux/bin/arm-linux-gcc -ggdb -o tcpsp-debug tcpsp.c
[root@server11 1st_application]# 11
total 92
-rw-r--r-- 1 root root 514 Nov 27 11:52 Makefile
-rwxr-xr-x 1 root root 25843 Nov 27 12:03 tops2-de
-rwxr-xr-x 1 root root 4996 Nov 27 12:03 tops2-de
-rw-r--rw-r-- 1 root root 4554 Nov 27 11:52 tops2.c
-rwxr-xr-x 1 root root 26823 Nov 27 12:03 tops-del
-rwxr-xr-x 1 root root 5396 Nov 27 12:03 topsp-re
-rw-r--r-- 1 root root 6164 Nov 27 11:55 topsp.c
[root@server11 1st_application]#
```

Two executable files, tcps2-release and tcps2-debug, are created.

**tcps2-release**—an ARM platform execution file (created specifically to run on the UC-7112-LX Plus).

**tcps2-debug**—an ARM platform GDB debug server execution file (see Chapter 5 for details about the GDB debug tool).

**NOTE** If you get an error message at this point, it could be because you neglected to put tcps2.c and tcpsp.c in the same directory. The example Makefile we provide is set up to compile both tcps2 and tcpsp into the same project Makefile. Alternatively, you could modify the Makefile to suit your particular requirements.

## Uploading and Running the "tcps2-release" Program

Use the following commands to use FTP to upload tcps2-release to the UC-7112-LX Plus.

1. From the PC, type:

#ftp 192.168.3.127

2. Next, use the **bin** command to set the transfer mode to **Binary**, and the **put** command to initiate the file transfer:

ftp> bin
ftp> put tcps2-release

```
[root@server11 1st_application]# ftp 192.168.3.127
Connected to 192.168.3.127
220 Moxa FTP server (Version wu-2.6.1(2) Mon Nov 24 12:17:04 CST 2003) ready.

#### Summary of Testing Procedure

- 1. Compile tcps2.c (#make).
- 2. Upload and run tcps2-release in the background (#./tcps2-release &).
- 3. Check that the process is running (#jobs or #ps -ef).
- 4. Use a serial cable to connect PC1 to the UC-7112-LX Plus's serial port 1.
- 5. Use an Ethernet cable to connect PC2 to the UC-7112-LX Plus.
- 6. On PC1: If running Windows, use HyperTerminal (38400, n, 8, 1) to open COMn.
- 7. On PC2: Type #telnet 192.168.3.127 4001.
- 8. On PC1: Type some text on the keyboard and then press Enter.
- 9. On PC2: The text you typed on PC1 will appear on PC2's screen.

The testing environment is illustrated in the following figure. However, note that there are limitations to the example program **tcps2.c**.

- **NOTE** The **tcps2.c** application is a simple example designed to give users a basic understanding of the concepts involved in combining Ethernet communication and serial port communication. However, the example program has some limitations that makes it unsuitable for real-life applications.
  - 1. The serial port is in canonical mode and block mode, making it impossible to send data from the Ethernet side to the serial side (i.e., from PC 2 to PC 1 in the above example).
  - 2. The Ethernet side will not accept multiple connections.

# Managing Embedded Linux

This chapter includes information about version control, deployment, updates, and peripherals. The information in this chapter will be particularly useful when you need to run the same application on several UC-7112-LX Plus units.

The following topics are covered in this chapter:

- □ System Version Information
- **Gamma** System Image Backup
  - > Upgrading the Firmware
  - Loading Factory Defaults
- **D** Enabling and Disabling Daemons
- **Given Setting the Run-Level**
- □ Adjusting the System Time
  - Setting the Time Manually
  - > NTP Client
  - Updating the Time Automatically
- **Cron—Daemon for Executing Scheduled Commands**

# **System Version Information**

To determine the hardware capability of your UC-7112-LX Plus, and what kind of software functions are supported, check the version numbers of your UC-7112-LX Plus's hardware, kernel, and user file system. Contact Moxa to determine the hardware version. You will need the **Production S/N** (Serial number), which is located on the UC-7112-LX Plus's bottom label.

To check the kernel version, type: **#kversion** 

192.168.3.127 - PuTTY root@Moxa:~# kversion Version 1.0 root@Moxa:~#

**NOTE** The kernel version number is for the factory default configuration. You may download the latest firmware version from Moxa's website and then upgrade the UC-7112-LX Plus's hardware.

# System Image Backup

# Upgrading the Firmware

The UC-7112-LX Plus's bios, kernel, and root file system are combined into one firmware file, which can be downloaded from Moxa's website (<u>www.moxa.com</u>). The name of the file has the form **uc7112plus-x.x.x.frm**, with "x.x.x" indicating the firmware version. To upgrade the firmware, download the firmware file to a PC, and then transfer the file to the UC-7112-LX Plus using a console port or Telnet console connection.

## ATTENTION

#### Upgrading the firmware will erase all data on the Flash ROM

If you are using the **ramdisk** to store code for your applications, beware that updating the firmware will erase all of the data on the Flash ROM. You should back up your application files and data before updating the firmware.

Since different Flash disks have different sizes, it is a good idea to check the size of your Flash disk before upgrading the firmware, or before using the disk to store your application and data files. Use the #df -h command to list the size of each memory block and how much free space is available in each block.

192.168.3.127 - PuTTY						
root@Moxa:~# df -h						
Filesystem S	ize Us	ed Availa	ble Use%	Mounted on		
/dev/mtdblock2	8.OM	6.0M	2.OM	75% /

root@Moxa:~# cd /mnt/ramdisk						
root@Moxa:/mnt	/ramdis	sk#				

The following instructions give the steps required to save the firmware file to the UC-7112-LX Plus's RAM disk and how to upgrade the firmware.

1. Type the following commands to enable the RAM disk:

```
#upramdisk
#cd /mnt/ramdisk
```

2. Type the following commands to use the UC-7112-LX Plus's built-in FTP client to transfer the firmware file (**uc7112plus-x.x.x.frm**) from the PC to the UC-7112-LX Plus:

```
/mnt/ramdisk> ftp <destination PC's IP>
Login Name: xxxx
Login Password: xxxx
ftp> bin
ftp> get uc7112plus-x.x.frm
```

192.168.3.127 - PuTTY
root@Moxa:/mnt/ramdisk# ftp 192.168.3.193
Connected to 192.168.3.193 (192.168.3.193).
220 TYPSoft FTP Server 1.10 ready
Name (192.168.3.193:root): root
331 Password required for root.
Password:
230 User root logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> cd newsw
250 CWD command successful. "/C:/ftproot/newsw/" is current directory.
ftp> bin
200 Type set to I.
ftp> ls
200 Port command successful.

226 Transfer complete.
13167772 bytes received in 2.17 secs (5925.8 kB/s)
ftp>

3. Next, use the **upfirm** command to upgrade the kernel and root file system:

```
#upfirm uc7112plus-x.x.frm
```

```
192.168.3.127 - PuTTY
root@Moxa:/mnt/ramdisk# upfirm uc7112plus-1.0.frm
Moxa UC-7112 Plus upgrade firmware utility version 1.0.
To check source firmware file context.
The source firmware file conext is OK.
This step will destroy all your firmware.
Continue ? (Y/N) : Y
Now upgrade the file [kernel].
Format MTD device [/dev/mtd1]
MTD device [/dev/mtd1] erase 128 Kibyte @ 1C0000 - 100% complete.
Wait to write file .
Compleleted 100%
Now upgrade the file [usrdisk].
Format MTD device [/dev/mtd2] . . .
MTD device [/dev/mtd2] erase 128 Kibyte @ 800000 - 100% complete.
Wait to write file .
Compleleted 100%
Upgrade the firmware is OK.
```

#### ATTENTION

The upfirm utility will reboot your target after the upgrade is OK. The UC-7112 Plus also offers firmware upgrade or system recovery through the boot loader utility. Please refer to **Appendix A: Boot Loader Utility for Firmware Upgrade or Recovery** for details.

# Loading Factory Defaults

To load the the factory default settings, you must press the reset button for more than 5 seconds. All files in the /home will be destroyed and /etc directory will be loaded with the default files. Note that while pressing the reset button, the Ready LED will blink once every second for the first 5 seconds. The Ready LED will turn off after 5 seconds, and the factory defaults will be loaded.

# **Enabling and Disabling Daemons**

The following daemons are enabled when the UC-7112-LX Plus boots up for the first time.

snmpd ......SNMP Agent daemon
telnetd .....Telnet Server / Client daemon
inetd .....Internet Daemons
ftpd.....FTP Server / Client daemon
sshd .....Secure Shell Server daemon
httpd .....Apache WWW Server daemon

Type the command "ps -ef" to list all processes currently running.

To run a private daemon, you can edit the file rc.local, as follows: #cd /etc/rc.d #vi rc.local

Next, use vi to open your application program. We use the example program **tcps2-release**, which we set to run in the background.

**192.168.3.127 - PuTTY** # !/bin/sh # Add you want to run daemon /root/tcps2-release &~

The enabled daemons will be available after you reboot the system.

# Setting the Run-Level

In this section, we outline the steps you should take to set the Linux run-level and execute requests. Use the following command to enable or disable settings:

192.168.3.127 - PuTTY	
root@Moxa:/ect/rc.d/rc3.d# ls S19nfs-common S25nfs-user-serverS99showreadyled S20snmpd S55ssh S24pcmcia S99rmnologin root@Moxa:/etc/rc.d/rc3.d#	

#cd /etc/rc.d/init.d

Edit a shell script to execute /root/tcps2-release and save to tcps2 as an example.

#cd /etc/rc.d/rc3.d
#ln -s /etc/rc.d/init.d/tcps2 S60tcps2

SxxRUNFILE stands for S: start the run file while linux boots up. xx: a number between 00-99. Smaller numbers have a higher priority. RUNFILE: the file name.

192.168.3.127 - PuTTY
root@Moxa:/ect/rc.d/rc3.d# ls
S19nfs-common S25nfs-user-serverS99showreadyled
S20snmpd S55ssh
S24pcmcia S99rmnologin
root@Moxa:/ect/rc.d/rc3.d# ln -s /root/tcps2-release S60tcps2
root@Moxa:/ect/rc.d/rc3.d# ls
S19nfs-common S25nfs-user-serverS99rmnologin
S20snmpd S55ssh S99showreadyled
S24pcmcia S60tcps2
root@Moxa:/etc/rc.d/rc3.d#

#### KxxRUNFILE stands for

K: start the run file while linux shuts down or halts. xx: a number between 00-99. Smaller numbers have a higher priority. RUNFILE: the file name.

To remove the daemon, remove the run file from the /etc/rc.d/rc3.d directory by using the following command:

#rm -f /etc/rc.d/rc3.d/S60tcps2

# Adjusting the System Time

# Setting the Time Manually

The UC-7112-LX Plus has two time settings. One is the system time, and the other is the RTC (Real Time Clock) time kept by the UC-7112-LX Plus's hardware. Use the #date command to query the current system time or set a new system time. Use #hwclock to query the current RTC time or set a new RTC time.

Use the following command to query the system time: **#date** 

Use the following command to query the RTC time: #hwclock

Use the following command to set the system time: #date MMDDhhmmYYYY

MM = Month DD = Date hhmm = hour and minute YYYY = Year

Use the following command to set the RTC time: #hwclock -w

Write current system time to RTC

The following figure illustrates how to update thesystem time and set the RTC time.

192.168.3.127 - PuTTY
root@Moxa:~# date
Fri Jun 23 23:30:31 CST 2000
root@Moxa:~# hwclock
Fri Jun 23 23:30:35 2000 -0.557748 seconds
root@Moxa:~# date 120910002004
Thu Dec 9 10:00:00 CST 2004
root@Moxa:~# hwclock -w
root@Moxa:~# date ; hwclock
Thu Dec 9 10:01:07 CST 2004
Thu Dec 9 10:01:08 2004 -0.933547 seconds
root@Moxa:~#

## **NTP Client**

The UC-7112-LX Plus has a built-in NTP (Network Time Protocol) client that is used to initialize a time request to a remote NTP server. Use #ntpdate <this client utility> to update the system time.

#ntpdate time.stdtime.gov.tw
#hwclock -w

Visit http://www.ntp.org for more information about NTP and NTP server addresses.

```
10.120.53.100 - PuTTY
root@Moxa:~# date ; hwclock
Sat Jan 1 00:00:36 CST 2000
Sat Jan 1 00:00:37 2000 -0.772941 seconds
root@Moxa:~# ntpdate time.stdtion.gov.tw
9 Dec 10:58:53 ntpdate[207]: step time server 220.130.158.52 offset 155905087.9
84256 sec
root@Moxa:~# hwclock -w
root@Moxa:~# date ; hwclock
Thu Dec 9 10:59:11 CST 2004
Thu Dec 9 10:59:12 2004 -0.844076 seconds
root@Moxa:~#
```

**NOTE** Before using the NTP client utility, check your IP and DNS settings to make sure that an Internet connection is available. Refer to Chapter 2 for instructions on how to configure the Ethernet interface, and see Chapter 4 for DNS setting information.

#### Updating the Time Automatically

In this subsection, we show how to use a shell script to update the time automatically.

Example shell script to update the system time periodically

Save the shell script using any file name. E.g., fixtime

#### How to run the shell script automatically when the kernel boots up

Copy the example shell script fixtime to directory /etc/init.d, and then use chmod 755 fixtime to change the shell script mode. Next, use vi editor to edit the file /etc/inittab. Add the following line to the bottom of the file:

ntp : 2345 : respawn : /etc/init.d/fixtime

Use the command #init q to re-init the kernel.

# **Cron—Daemon for Executing Scheduled Commands**

Start Cron from the directory /etc/rc.local. It will return immediately, so you don't need to start it with '&' to run in the background.

The Cron daemon will search /etc/cron.d/crontab for crontab files, which are named after accounts in /etc/passwd.

Cron wakes up every minute, and checks each command to see if it should be run in that minute. When executing commands, output is mailed to the owner of the crontab (or to the user named in the MAILTO environment variable in the crontab, if such a user exists).

Modify the file /etc/cron.d/crontab to set up your scheduled applications. Crontab files have the following format:

mm	Н	dom	mon	dow	user	command
min	Hour	date	month	week	user	command
0-59	0-23	1-31	1-12	0-6 (0 is Sunday)		

The following example demonstrates how to use Cron.

How to use cron to update the system time and RTC time every day at 8:00.

#### STEP1: Write a shell script named fixtime.sh and save it to /home/.

#!/bin/sh
ntpdate time.nist.gov
hwclock -systohc
exit 0

#### STEP2: Change mode of fixtime.sh

#chmod 755 fixtime.sh

#### STEP3: Modify /etc/cron.d/crontab file to run fixtime.sh at 8:00 every day.

Add the following line to the end of crontab:

\* 8 \* \* \* root/home/fixtime.sh

#### **STEP4: Enable the cron daemon manually.**

#/etc/init.d/cron start

#### STEP5: Enable cron when the system boots up.

Add the following line in the file /etc/init.d/rc.local

#/etc/init.d/cron start

4

# **Managing Communications**

In this chapter, we explain how to configure the UC-7112-LX Plus's various communication functions.

The following topics are covered in this chapter:

- **Telnet / FTP**
- **D** DNS
- □ Web Service—Apache
- □ Installing PHP for Apache Web Server
- **IPTABLES**
- □ NAT
  - > NAT Example
  - Enabling NAT at Bootup
- Dial-up Service—PPP
- **D** PPPoE
- □ NFS (Network File System)
  - ▶ Setting up the UC-7112-LX Plus as an NFS Client
- Mail
- □ SNMP
- **OpenVPN**

# **Telnet / FTP**

In addition to supporting Telnet client/server and FTP client/server, the UC-7112-LX Plus also supports SSH and sftp client/server. To enable or disable the Telnet/ftp server, you first need to edit the file /etc/inetd.conf.

#### **Enabling the Telnet/ftp server**

The following example shows the default content of the file /etc/inetd.conf. The default is to enable the Telnet/ftp server:

discard dgram udp wait root /bin/discard discard stream tcp nowait root /bin/discard telnet stream tcp nowait root /bin/telnetd ftp stream tcp nowait root /bin/ftpd -l

#### **Disabling the Telnet/ftp server**

Disable the daemon by typing '#' in front of the first character of the row to comment out the line.

# DNS

The UC-7112-LX Plus supports DNS client (but not DNS server). To set up DNS client, you need to edit three configuration files: /etc/hosts, /etc/resolv.conf, and /etc/nsswitch.conf.

#### /etc/hosts

This is the first file that the Linux system reads to resolve the host name and IP address.

#### /etc/resolv.conf

This is the most important file that you need to edit when using DNS for the other programs. For example, before you use #ntpdate time.nist.goc to update the system time, you will need to add the DNS server address to the file. Ask your network administrator which DNS server address you should use. The DNS server's IP address is specified with the "nameserver" command. For example, add the following line to /etc/resolv.conf if the DNS server's IP address is 168.95.1.1:

nameserver 168.95.1.1

10.120.53.100 - PuTTY
root@Moxa:/etc# cat resolv.conf
# resolv.conf This file is the resolver configuration file
# See resolver(5).
#
#nameserver 192.168.1.16
nameserver 168.95.1.1
nameserver 140.115.1.31
nameserver 140.115.236.10
root@Moxa:/etc#

#### /etc/nsswitch.conf

This file defines the sequence to resolve the IP address by using /etc/hosts file or /etc/resolv.conf.

# Web Service—Apache

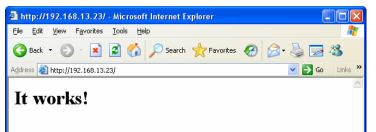

The Apache web server's main configuration file is /etc/apache/conf/httpd.conf, with the default homepage located at /home/httpd/htdocs/index.html. Save your own homepage to the following directory:

#### /home/httpd/htdocs/

Save your CGI page to the following directory:

#### /home/httpd/cgi-bin/

Before you modify the homepage, use a browser (such as Microsoft Internet Explorer or Mozilla Firefox) from your PC to test if the Apache Web Server is working. Type the LAN1 IP address in the browser's address box to open the homepage. E.g., if the default IP address is still active, type **http://192.168.3.127** in the address box.

To open the default CGI page, type http://192.168.3.127/cgi-bin/test-cgi in your browser's address box.

### Installing PHP for Apache Web Server

This embedded computer supports the PHP option. However, since the PHP file is 3 MB, it is not installed by default. To install it yourself, first make sure there is enough free space (at least 3 MB) on your embedded flash ROM).

**Step 1:** Check that you have enough free space. You should have at least 3 MB of free space in the **directory /dev/mtdblock3**.

192.168.3.127 - Pt	ITTY		
root@Moxa:/bin# df	-h		
Filesystem	Size	Used Available Use% Mounted on	
/dev/mtdblock2	8.OM	6.0M 2.0M 75% /	
/dev/ram0	499.0k	17.0k 457.0k 4% /var	
/dev/mtdblock3	6.OM	488.0k 5.5M 8% /tmp	
/dev/mtdblock3	6.OM	488.0k 5.5M 8% /home	
/dev/mtdblock3	6.OM	488.0k 5.5M 8% /etc	
tmpfs	30.4M	0 30.4M 0% /dev/shm	
root@Moxa:/bin#			

Step 2: Type 'upramdisk' to get the free space ram disk to save the package.

192.168.3.127 -	PuTTY			
root@Moxa:/bin# ι	-			
root@Moxa:/bin# d	lf -h			
Filesystem	Size	Used A	vailable Use% Mounted on	
/dev/mtdblock2	8.OM	6.OM	2.0M 75% /	
/dev/ram0	499.0k	18.0k	456.0k 4% /var	
/dev/mtdblock3	6.OM	488.0k	5.5M 8% /tmp	
/dev/mtdblock3	6.OM	488.0k	5.5M 8% /home	
/dev/mtdblock3	6.OM	488.0k	5.5M 8% /etc	
tmpfs	30.4M	0	30.4M	
/dev/ram1	16.0M	1.0k	15.1M 0% /var/ramdisk	
root@Moxa:/bin#				

**Step 3:** Download the PHP package from the CD-ROM. You can find the package in **CD-ROM/software/php/php.tar.gz.** 

192.168.3.127 - PuTTY
root@Moxa:/bin# cd /mnt/ramdisk
root@Moxa:/mnt/ramdisk# ftp 192.168.27.130
Connected to 192.168.27.130.
220 (vsFTPd 2.0.1)
Name (192.168.27.130:root): root
331 Please specify the password.
Password:
230 Login successful.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> cd /tmp
250 Directory successfully changed.
ftp> bin
200 Switching to Binary mode.
ftp> get php.tar.gz
local: php.tar.gz remote: php.tar.gz
200 PORT command successful. Consider using PASV.
150 Opening BINARY mode data connection for php.tar.gz (1789032 bytes).
226 File send OK.
1789032 bytes received in 0.66 secs (2.6e+03 Kbytes/sec)
ftp>

Step 4: untar the package. To do this, type the command 'tar xvzf php.tar.gz'.

192.168.3.127 - PuTTY
root@Moxa:/mnt/ramdisk# tar xvzf php.tar.gz
envvars
envvars.old
httpd.conf
httpd.conf.old
install.sh
lib
lib/libmysqlclient.so.15
lib/libpng.so.2
lib/libphp5.so
lib/libmysqlclient.so.15.0.0
lib/libgd.so
lib/libxml2.so.2.6.22
lib/libgd.so.2.0.0
lib/libjpeg.so
lib/libxml2.so.2
lib/libgd.so.2
php
php/php.ini
phpinfo.php
root@Moxa:/mnt/ramdisk#

Step 5: Run 'install.sh' and select to install php.

```
192.168.3.127 - PUTTY

root@Moxa:/mnt/ramdisk# ./install.sh

Press the number:

1. Install PHP package

2. Uninstall PHP package

3. Exit.

1

Start to install PHP. Please wait ...

Starting web server: apache.

PHP install sucess.

root@Moxa:/mnt/ramdisk#
```

Step 6: Test it. Use the browser to access <u>http://192.168.3.127/phpinfo.php</u>

If you want to uninstall PHP, follow steps 2 to 5 but select the uninstall option.

### **IPTABLES**

IPTABLES is an administrative tool for setting up, maintaining, and inspecting the Linux kernel's IP packet filter rule tables. Several different tables are defined, with each table containing built-in chains and user-defined chains.

Each chain is a list of rules that apply to a certain type of packet. Each rule specifies what to do with a matching packet. A rule (such as a jump to a user-defined chain in the same table) is called a "target."

The UC-7112-LX Plus supports 3 types of IPTABLES table: **Filter** tables, **NAT** tables, and **Mangle** tables:

A. Filter Table—includes three chains:

INPUT chain OUTPUT chain FORWARD chain

B. NAT Table—includes three chains:

PREROUTING chain—transfers the destination IP address (DNAT) POSTROUTING chain—works after the routing process and before the Ethernet device

process to transfer the source IP address (SNAT)

OUTPUT chain-produces local packets

sub-tables

Source NAT (SNAT)-changes the first source packet IP address

Destination NAT (DNAT)-changes the first destination packet IP address

MASQUERADE—a special form for SNAT. If one host can connect to Internet, then other computers that connect to this host can connect to the Internet when the computer does not have an actual IP address.

REDIRECT—a special form of DNAT that re-sends packets to a local host independent of the destination IP address.

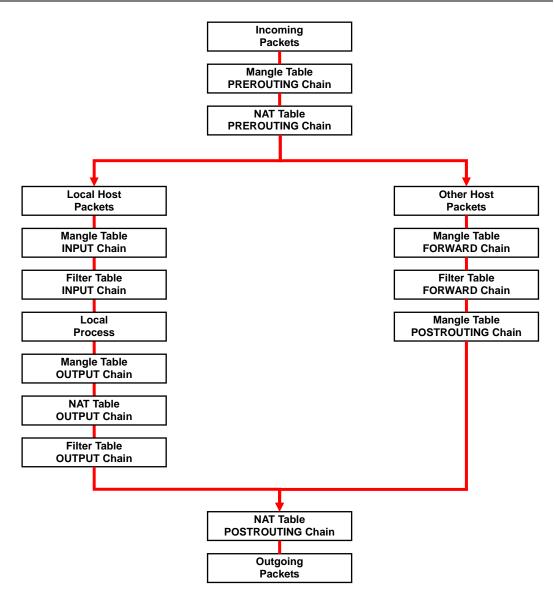

C. Mangle Table-includes two chains

PREROUTING chain-pre-processes packets before the routing process.

OUTPUT chain-processes packets after the routing process.

It has three extensions—TTL, MARK, TOS.

The following figure shows the IPTABLES hierarchy.

The UC-7112-LX Plus supports the following sub-modules. Be sure to use the module that matches your application.

ip_conntrack	_conntrack ipt_MARK		ipt_state
ip_conntrack_ftp	ipt_MASQUERADE	ipt_esp	ipt_tcpmss
ipt_conntrack_irc	conntrack_irc ipt_MIRROT		ipt_tos
ip_nat_ftp ipt_REDIRECT		ipt_limit	ipt_ttl
ip_nat_irc ipt_REJECT		ipt_mac	ipt_unclean
ip_nat_snmp_basic	ipt_TCPMSS	ipt_mark	
ip_queue	ipt_TOS	ipt_multiport	
ipt_LOG ipt_ULOG		ipt_owner	

#### NOTE The UC-7112-LX Plus does NOT support IPV6 and ipchains.

The basic syntax to enable and load an IPTABLES module is as follows:

#1smod #modprobe ip\_tables #modprobe iptable\_filter Use 1smod to check if the ip\_tables module has already been loaded in the UC-7112-LX Plus. Use modprobe to insert and enable the module.

Use the following command to load the modules (iptable\_filter, iptable\_mangle, iptable\_nat):

#modprobe iptable\_filter

NOTE IPTABLES plays the role of packet filtering or NAT. Take care when setting up the IPTABLES rules. If the rules are not correct, remote hosts that connect via a LAN or PPP may be denied access. We recommend using the serial console to set up the IPTABLES.

Click on the following links for more information about iptables.

http://www.linuxguruz.com/iptables/ http://www.netfilter.org/documentation/HOWTO//packet-filtering-HOWTO.html

Since the IPTABLES command is very complex, to illustrate the IPTABLES syntax we have divided our discussion of the various rules into three categories: Observe and erase chain rules, Define policy rules, and Append or delete rules.

### Observe and erase chain rules

### Usage:

# iptables [-t tables] [-L] [-n]

-t tables: Table to manipulate (default: 'filter'); example: nat or filter.

- -L [chain]: ListList all rules in selected chains. If no chain is selected, all chains are listed. Numeric output of addresses and ports. -n:
- # iptables [-t tables] [-FXZ]
  - -F: Flush the selected chain (all the chains in the table if none is listed).
  - -X: Delete the specified user-defined chain.
  - -Z: Set the packet and byte counters in all chains to zero.

### **Examples:**

# iptables -L -n

In this example, since we do not use the -t parameter, the system uses the default 'filter' table. Three chains are included: INPUT, OUTPUT, and FORWARD. INPUT chains are accepted automatically, and all connections are accepted without being filtered.

```
#iptables -F
#iptables -X
#iptables -Z
```

### Define policy for chain rules

#### Usage:

# iptables [-t tables] [-P] [INPUT, OUTPUT, FORWARD, PREROUTING, OUTPUT, POSTROUTING]
[ACCEPT, DROP]
-P: Set the policy for the chain to the given target.
INPUT: For packets coming into the UC-7112-LX Plus.
OUTPUT: For locally-generated packets.
FORWARD: For packets routed out through the UC-7112-LX Plus.
PREROUTING: To alter packets as soon as they come in.

POSTROUTING: To alter packets as they are about to be sent out.

#### **Examples:**

#iptables -P INPUT DROP #iptables -P OUTPUT ACCEPT #iptables -P FORWARD ACCEPT #iptables -t nat -P PREROUTING ACCEPT #iptables -t nat -P OUTPUT ACCEPT #iptables -t nat -P POSTROUTING ACCEPT

In this example, the policy accepts outgoing packets and denies incoming packets.

### Append or delete rules:

### Usage:

# iptables [-t table] [-AI] [INPUT, OUTPUT, FORWARD] [-io interface] [-p tcp, udp, icmp, all] [-s IP/network] [--sport ports] [-d IP/network] [--dport ports] -j [ACCEPT. DROP]

- -A: Append one or more rules to the end of the selected chain.
- -I: Insert one or more rules in the selected chain as the given rule number.
- -i: Name of an interface via which a packet is going to be received.
- -o: Name of an interface via which a packet is going to be sent.
- -p: The protocol of the rule or of the packet to check.
- -s: Source address (network name, host name, network IP address, or plain IP address).
- --sport: Source port number.
- -d: Destination address.

--dport:Destination port number.

-j: Jump target. Specifies the target of the rules; i.e., how to handle matched packets. For example, ACCEPT the packet, DROP the packet, or LOG the packet.

### **Examples:**

Example 1: Accept all packets from lo interface. # iptables -A INPUT -i lo -j ACCEPT

Example 2: Accept TCP packets from 192.168.0.1. # iptables -A INPUT -i eth0 -p tcp -s 192.168.0.1 -j ACCEPT

Example 3: Accept TCP packets from Class C network 192.168.1.0/24. # iptables -A INPUT -i eth0 -p tcp -s 192.168.1.0/24 -j ACCEPT

Example 4: Drop TCP packets from 192.168.1.25. # iptables -A INPUT -i eth0 -p tcp -s 192.168.1.25 -j DROP

Example 5: Drop TCP packets addressed for port 21. # iptables -A INPUT -i eth0 -p tcp --dport 21 -j DROP

Example 6: Accept TCP packets from 192.168.0.24 to UC-7112-LX Plus's port 137, 138, 139 # iptables -A INPUT -i eth0 -p tcp -s 192.168.0.24 --dport 137:139 -j ACCEPT Example 7: Drop all packets from MAC address 01:02:03:04:05:06. # iptables -A INPUT -i eth0 -p all -m mac --mac-source 01:02:03:04:05:06 -j DROP

**NOTE:** In Example 7, remember to issue the command #modprobe ipt\_mac first to load module ipt\_mac.

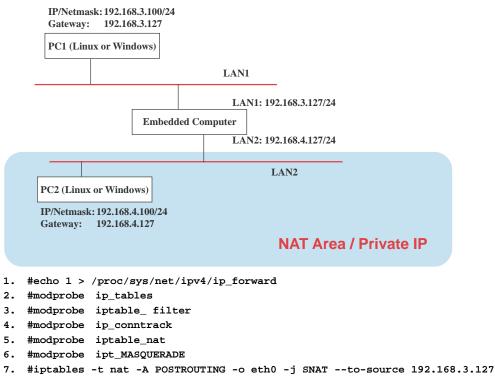

### NAT

NAT (Network Address Translation) protocol translates IP addresses used on one network to different IP addresses used on another network. One network is designated the inside network and the other is the outside network. Typically, the UC-7112-LX Plus connects several devices on a network and maps local inside network addresses to one or more global outside IP addresses, and un-maps the global IP addresses on incoming packets back into local IP addresses.

**NOTE** Click on the following link for more information about iptables and NAT: http://www.netfilter.org/documentation/HOWTO/NAT-HOWTO.html

### NAT Example

The IP address of LAN1 is changed to 192.168.3.127 (you will need to load the module ipt\_MASQUERADE):

8. #iptables -t nat -A POSTROUTING -o eth0 -s 192.168.3.0/24 -j MASQUERADE

### Enabling NAT at Bootup

In most real world situations, you will want to use a simple shell script to enable NAT when the UC-7112-LX Plus boots up. The following script is an example.

```
#!/bin/bash
# If you put this shell script in the /home/nat.sh
# Remember to chmod 744 /home/nat.sh
# Edit the rc.local file to make this shell startup automatically.
# vi /etc/rc.d/rc.local
# Add a line in the end of rc.local /home/nat.sh
EXIF='eth0' #This is an external interface for setting up a valid IP address.
EXNET='192.168.4.0/24' #This is an internal network address.
# Step 1. Insert modules.
# Here 2> /dev/null means the standard error messages will be dump to null device.
modprobe ip_tables 2> /dev/null
modprobe ip_nat_ftp 2> /dev/null
modprobe ip_nat_irc 2> /dev/null
modprobe ip_conntrack 2> /dev/null
modprobe ip_conntrack_ftp 2> /dev/null
modprobe ip_conntrack_irc 2> /dev/null
# Step 2. Define variables, enable routing and erase default rules.
PATH=/bin:/sbin:/usr/bin:/usr/local/bin:/usr/local/sbin
export PATH
echo "1" > /proc/sys/net/ipv4/ip_forward
/bin/iptables -F
/bin/iptables -X
/bin/iptables -Z
/bin/iptables -F -t nat
/bin/iptables -X -t nat
/bin/iptables -Z -t nat
/bin/iptables -P INPUT ACCEPT
/bin/iptables -P OUTPUT ACCEPT
/bin/iptables -P FORWARD ACCEPT
/bin/iptables -t nat -P PREROUTING ACCEPT
/bin/iptables -t nat -P POSTROUTING ACCEPT
/bin/iptables -t nat -P OUTPUT
                                    ACCEPT
# Step 3. Enable IP masquerade.
```

### Dial-up Service—PPP

PPP (Point to Point Protocol) is used to run IP (Internet Protocol) and other network protocols over a serial link. PPP can be used for direct serial connections (using a null-modem cable) over a Telnet link, and links established using a modem over a telephone line.

Modem / PPP access is almost identical to connecting directly to a network through the UC-7112-LX Plus's Ethernet port. Since PPP is a peer-to-peer system, the UC-7112-LX Plus can also use PPP to link two networks (or a local network to the Internet) to create a Wide Area Network (WAN).

**NOTE** Click on the following links for more information about ppp: <u>http://tldp.org/HOWTO/PPP-HOWTO/index.html</u> <u>http://axion.physics.ubc.ca/ppp-linux.html</u> The pppd daemon is used to connect to a PPP server from a Linux system. For detailed information about pppd see the man page.

### Example 1: Connecting to a PPP server over a simple dial-up connection

The following command is used to connect to a PPP server by modem. Use this command for old ppp servers that prompt for a login name (replace *username* with the correct name) and password (replace *password* with the correct password). Note that *debug* and *defaultroute 192.1.1.17* are optional.

#pppd connect `chat -v `` ATDT5551212 CONNECT`` ogin: username word: password' /dev/ttyM0 115200 debug crtscts modem defaultroute

If the PPP server does not prompt for the username and password, the command should be entered as follows. Replace *username* with the correct username and replace *password* with the correct password.

#pppd connect `chat -v `` ATDT5551212 CONNECT`` ` user username password password /dev/ttyM0 115200 crtscts modem

The pppd options are described below:

#### connect 'chat etc...'

This option gives the command to contact the PPP server. The 'chat' program is used to dial a remote computer. The entire command is enclosed in single quotes because pppd expects a one-word argument for the 'connect' option. The options for 'chat' are given below:

-v

verbose mode; log what we do to syslog

n n

Double quotes—don't wait for a prompt, but instead do ... (note that you must include a space after the second quotation mark)

ATDT5551212 Dial the modem, and then ...

CONNECT Wait for an answer.

n n

Send a return (null text followed by the usual return)

### ogin: username word: password

Log in with username and password.

Refer to the chat man page, chat.8, for more information about the chat utility.

#### /dev/

Specify the callout serial port.

115200

The baudrate.

debug

Log status in syslog.

### crtscts

Use hardware flow control between computer and modem (at 115200 this is a must).

#### modem

Indicates that this is a modem device; pppd will hang up the phone before and after making the call.

#### defaultroute

Once the PPP link is established, make it the default route; if you have a PPP link to the Internet, this is probably what you want.

### 192.1.1.17

This is a degenerate case of a general option of the form x.x.x.x:y.y.y.y. Here x.x.x.x is the local IP address and y.y.y.y is the IP address of the remote end of the PPP connection. If this option is not specified, or if just one side is specified, then x.x.x.x defaults to the IP address associated with the local machine's hostname (located in **/etc/hosts**), and y.y.y.y is determined by the remote machine.

### Example 2: Connecting to a PPP server over a hard-wired link

If a username and password are not required, use the following command (note that *noipdefault* is optional):

#pppd connect 'chat -v" " " ' noipdefault /dev/ttyM0 19200 crtscts

If a username and password is required, use the following command (note that *noipdefault* is optional, and *root* is both the username and password): #pppd connect `chat -v" " " " ` user root password root noipdefault /dev/ttyM0 19200 crtscts

### How to check the connection

Once you've set up a PPP connection, there are some steps you can take to test the connection. First, type:

#### /sbin/ifconfig

(The folder **ifconfig** may be located elsewhere, depending on your distribution.) You should be able to see all the network interfaces that are UP. ppp0 should be one of them, and you should recognize the first IP address as your own, and the "P-t-P address" (or point-to-point address) the address of your server. Here's what it looks like on one machine:

lo	Link encap Local Loopback
	inet addr 127.0.0.1 Bcast 127.255.255.255 Mask 255.0.0.0
	UP LOOPBACK RUNNING MTU 2000 Metric 1
	RX packets 0 errors 0 dropped 0 overrun 0
ppp0	Link encap Point-to-Point Protocol
	inet addr 192.76.32.3 P-t-P 129.67.1.165 Mask 255.255.255.0
	UP POINTOPOINT RUNNING MTU 1500 Metric 1

Now, type:

ping z.z.z.z

where z.z.z.z is the address of your name server. This should work. Here's what the response could look like:

waddington:~\$p ping 129.67.1.165 PING 129.67.1.165 (129.67.1.165): 56 data bytes 64 bytes from 129.67.1.165: icmp\_seq=0 ttl=225 time=268 ms 64 bytes from 129.67.1.165: icmp\_seq=1 ttl=225 time=247 ms 64 bytes from 129.67.1.165: icmp\_seq=2 ttl=225 time=266 ms ^C --- 129.67.1.165 ping statistics ---3 packets transmitted, 3 packets received, 0% packet loss round-trip min/avg/max = 247/260/268 ms waddington:~\$

RX packets 33 errors 0 dropped 0 overrun 0 TX packets 42 errors 0 dropped 0 overrun 0 Try typing:

netstat -nr

This should show three routes, something like this:

Kernel routing ta	able					
Destination	Gateway	Genmask	Flags	Metric	Ref	Use
iface	·		•			
129.67.1.165	0.0.00	255.255.255.255	UH	0	0	6
ppp0						
127.0.0.0	0.0.0	255.0.0.0	U	0	0	0 lo
0.0.0.0	129.67.1.165	0.0.0.0	UG	0	0	6298
ppp0						

If your output looks similar but doesn't have the destination 0.0.0 line (which refers to the default route used for connections), you may have run pppd without the 'defaultroute' option. At this point you can try using Telnet, ftp, or finger, bearing in mind that you'll have to use numeric IP addresses unless you've set up /etc/resolv.conf correctly.

### Setting up a Machine for Incoming PPP Connections

This first example applies to using a modem, and requiring authorization with a username and password.

pppd/dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2 login auth

You should also add the following line to the file /etc/ppp/pap-secrets:

\* \* "" \*

The first star (\*) lets everyone login. The second star (\*) lets every host connect. The pair of double quotation marks ("") is to use the file **/etc/passwd** to check the password. The last star (\*) is to let any IP connect.

The following example does not check the username and password:

pppd/dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2

### **PPPoE**

- 1. Connect the UC-7112-LX Plus's LAN port to an ADSL modem with a cross-over cable, HUB, or switch.
- 2. Log in to the UC-7112-LX Plus as the root user.
- 3. Edit the file /etc/ppp/chap-secrets and add the following: "username@hinet.net"\*"password"\*

**"username@hinet.net"** is the username obtained from the ISP to log in to the ISP account. **"password"** is the corresponding password for the account.

### UC-7112-LX Plus Software User's Manual

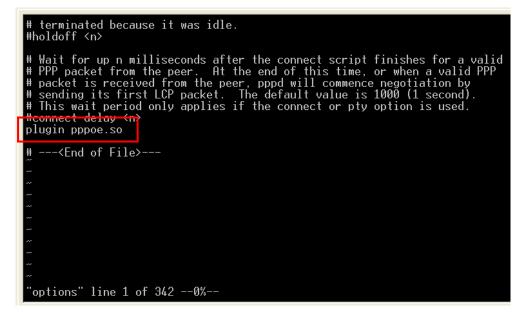

4. Edit the file /etc/ppp/pap-secrets and add the following: "username@hinet.net""#"password"\*

<pre># password if you don't use the login option of pppd! The mgetty Debian # package already provides this option; make sure you don't change that.</pre>
# INBOUND connections
# Every regular user can use PPP and has to use passwords from /etc/passwd hostname "username@hinet.net" * "password" *
<pre># UserIDs that cannot use PPP at all. Check your /etc/passwd and add any # other accounts that should not be able to use pppd! guest hostname "*" - master hostname "*" - root hostname "*" - support hostname "*" - stats hostname "*" -</pre>
# OUTBOUND connections
<pre># Here you should add your userid password to connect to your providers via # PAP. The * means that the password is to be used for ANY host you connect # to. Thus you do not have to worry about the foreign machine name. Just # replace password with your password. "pap-secrets" line 1 of 422%</pre>

"username@hinet.net" is the username obtained from the ISP to log in to the ISP account. "password" is the corresponding password for the account.

5. Edit the file /etc/ppp/options and add the following line:

plugin pppoe

#### UC-7112-LX Plus Software User's Manual

6. Add one of two files: /etc/ppp/options.eth0 or /etc/ppp/options.eth1. The choice depends on which LAN is connected to the ADSL modem. If you use LAN1 to connect to the ADSL modem, then add /etc/ppp/options.eth0. If you use LAN2 to connect to the ADSL modem, then add /etc/ppp/options.eth1. The file context is shown below:

name username@hinet.net mtu 1492	
mru 1492 defaultroute	
noipdefault	
~	
~	
~	
~	
~	
~	
~	
~	
"options.ixp0" line 1 of	520%

Type your username (the one you set in the /etc/ppp/pap-secrets and /etc/ppp/chap-secrets files) after the "name" option. You may add other options as desired.

7. Set up DNS.

If you are using DNS servers supplied by your ISP, edit the file

/etc/resolv.conf by adding the following lines of code:

```
nameserver ip_addr_of_first_dns_server
nameserver ip_addr_of_second_dns_server
```

For example:

nameserver 168..95.1.1 nameserver 139.175.10.20

8. Use the following command to create a pppoe connection:

### pppd eth0

The eth0 is what is connected to the ADSL modem LAN port. The example above uses LAN1. To use LAN2, type:

### pppd eth1

- 9. Type **ifconfig ppp0** to check if the connection is OK or has failed. If the connection is OK, you will see information about the ppp0 setting for the IP address. Use ping to test the IP.
- 10. If you want to disconnect it, use the kill command to kill the pppd process.

### NFS (Network File System)

The Network File System (NFS) is used to mount a disk partition on a remote machine, as if it were on a local hard drive, allowing fast, seamless sharing of files across a network. NFS allows users to develop applications for the UC-7112-LX Plus, without worrying about the amount of disk space that will be available. The UC-7112-LX Plus supports NFS protocol for client.

```
NOTE Click on the following links for more information about NFS:
<u>http://www.tldp.org/HOWTO/NFS-HOWTO/index.html</u>
<u>http://nfs.sourceforge.net/nfs-howto/client.html</u>
http://nfs.sourceforge.net/nfs-howto/server.html
```

### Setting up the UC-7112-LX Plus as an NFS Client

The following procedure is used to mount a remote NFS Server.

- 1. To know the NFS Server's shared directory.
- 2. Establish a mount point on the NFS Client site.
- 3. Mount the remote directory to a local directory.

```
#mkdir -p /home/nfs/public
#mount -t nfs NFS_Server(IP):/directory /mount/point
```

```
Example
#mount -t nfs 192.168.3.100:/home/public /home/nfs/public
```

### Mail

smtpclient is a minimal SMTP client that takes an email message body and passes it on to an SMTP server. It is suitable for applications that use email to send alert messages or important logs to a specific user.

**NOTE** Click on the following link for more information about smtpclient: <u>http://www.engelschall.com/sw/smtpclient/</u>

To send an email message, use the 'smtpclient' utility, which uses SMTP protocol. Type **#smtpclient** -help to see the help message.

#### **Example:**

```
smtpclient -s test -f sender@company.com -S IP_address receiver@company.com
< mail-body-message</pre>
```

- -s: The mail subject.
- -f: Sender's mail address
- -S: SMTP server IP address

The last mail address **receiver@company.com** is the receiver's e-mail address. **mail-body-message** is the mail content. The last line of the body of the message should contain ONLY the period '.' character.

You will need to add your hostname to the file /etc/hosts.

### SNMP

The UC-7112-LX Plus has built-in SNMP V1 (Simple Network Management Protocol) agent software. It supports RFC1317 RS-232 like group and RFC 1213 MIB-II.

See Appendix B for a simple example that allows you to use an SNMP browser on the host site to query the UC-7112-LX Plus, which is the SNMP agent. The UC-7112-LX Plus will respond.

**NOTE** Click on the following links for more information about MIB II and RS-232 like groups: <u>http://www.faqs.org/rfcs/rfc1213.html</u> <u>http://www.faqs.org/rfcs/rfc1317.html</u>

 $\rightarrow$  UC-7112-LX Plus does NOT support SNMP trap.

### **OpenVPN**

OpenVPN provides two types of tunnels for users to implement VPNS: **Routed IP Tunnels** and **Bridged Ethernet Tunnels**. To begin with, check to make sure that the system has a virtual device /**dev/net/tun**. If not, issue the following command:

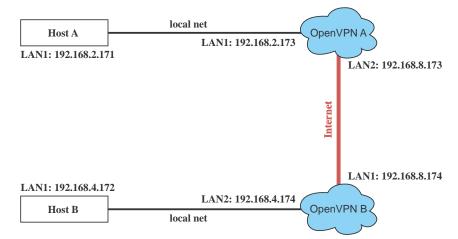

# mknod /dev/net/tun c 10 200

An Ethernet bridge is used to connect different Ethernet networks together. The Ethernets are bundled into one bigger, "logical" Ethernet. Each Ethernet corresponds to one physical interface (or port) that is connected to the bridge.

On each OpenVPN machine, you should generate a working directory, such as **/etc/openvpn**, where script files and key files reside. Once established, all operations will be performed in that directory.

### Setup 1: Ethernet Bridging for Private Networks on Different Subnets

1. Set up four machines, as shown in the following diagram.

Host A (B) represents one of the machines that belongs to OpenVPN A (B). The two remote subnets are configured for a different range of IP addresses. When this setup is moved to a public network, the external interfaces of the OpenVPN machines should be configured for static IPs, or connect to another device (such as a firewall or DSL box) first.

# openvpn --genkey --secret secrouter.key

Copy the file that is generated to the OpenVPN machine.

2. Generate a script file named **openvpn-bridge** on each OpenVPN machine. This script reconfigures interface "eth1" as IP-less, creates logical bridge(s) and TAP interfaces, loads modules, enables IP forwarding, etc.

```
#-----Start-----
#!/bin/sh
iface=eth1 # defines the internal interface
maxtap=`expr 1` # defines the number of tap devices. I.e., # of tunnels
IPADDR=
NETMASK=
BROADCAST=
# it is not a great idea but this system doesn't support
# /etc/sysconfig/network-scripts/ifcfg-eth1
ifcfg_vpn()
{
while read f1 f2 f3 f4 r3
do
 if [ "$f1" = "iface" -a "$f2" = "$iface" -a "$f3" = "inet" -a "$f4" = "static" ];then
  i=`expr 0`
  while :
  do
   if [ $i -gt 5 ]; then
    break
   fi
   i=`expr $i + 1`
   read f1 f2
   case "$f1" in
    address ) IPADDR=$f2
      ;;
    netmask ) NETMASK=$f2
     ;;
    broadcast ) BROADCAST=$f2
     ;;
   esac
  done
     break
 fi
done < /etc/network/interfaces</pre>
}
# get the ip address of the specified interface
mname=
module_up()
{
oIFS=$IFS
IFS=`
FOUND="no"
for LINE in `lsmod`
do
 TOK=`echo $LINE | cut -d' ` -f1`
if [ `$TOK" = `$mname" ]; then
  FOUND="yes";
  break;
 fi
done
IFS=$0IFS
if [ "$FOUND" = "no" ]; then
 modprobe $mname
fi
}
```

```
start()
ł
ifcfg_vpn
if [ ! \( -d "/dev/net" \) ]; then
mkdir /dev/net
fi
if [ ! \( -r "/dev/net/tun" \) ]; then
 # create a device file if there is none
 mknod /dev/net/tun c 10 200
fi
# load modules "tun" and "bridge"
mname=tun
module_up
mname=bridge
module_up
# create an ethernet bridge to connect tap devices, internal interface
brctl addbr br0
brctl addif br0 $iface
# the bridge receives data from any port and forwards it to other ports.
i=`expr 0`
while :
do
 # generate a tap0 interface on tun
 openvpn --mktun --dev tap${i}
 # connect tap device to the bridge
 brctl addif br0 tap${i}
 # null ip address of tap device
 ifconfig tap${i} 0.0.0.0 promisc up
 i=`expr $i + 1`
 if [ $i -ge $maxtap ]; then
  break
 fi
done
# null ip address of internal interface
ifconfig $iface 0.0.0.0 promisc up
# enable bridge ip
ifconfig br0 $IPADDR netmask $NETMASK broadcast $BROADCAST
ipf=/proc/sys/net/ipv4/ip_forward
# enable IP forwarding
echo 1 > $ipf
echo "ip forwarding enabled to"
cat $ipf
}
stop() {
echo "shutdown openvpn bridge."
ifcfg_vpn
i=`expr 0`
while :
do
 # disconnect tap device from the bridge
 brctl delif br0 tap${i}
 openvpn --rmtun --dev tap${i}
 i=`expr $i + 1`
 if [ $i -ge $maxtap ]; then
  break
 fi
```

done

```
brctl delif br0 $iface
   brctl delbr br0
   ifconfig br0 down
   ifconfig $iface $IPADDR netmask $NETMASK broadcast $BROADCAST
   killall -TERM openvpn
   }
   case "$1" in
   start)
    start
    ;;
   stop)
    stop
    ;;
   restart)
    stop
    start
    ;;
   *)
    echo "Usage: $0 [start|stop|restart]"
    exit 1
   esac
   exit 0
   #---
        ----- end -----
   Create link symbols to enable this script at boot time:
   # ln -s /etc/openvpn/openvpn-bridge /etc/rc.d/rc3.d/S32vpn-br # for example
   # ln -s /etc/openvpn/openvpn-bridge /etc/rc.d/rc6.d/K32vpn-br # for example
3. Create a configuration file named A-tap0-br.conf and an executable script file named
   A-tap0-br.sh on OpenVPN A.
   # point to the peer
   remote 192.168.8.174
   dev tap0
   secret /etc/openvpn/secrouter.key
   cipher DES-EDE3-CBC
   auth MD5
   tun-mtu 1500
   tun-mtu-extra 64
   ping 40
   up /etc/openvpn/A-tap0-br.sh
   #-----Start-----Start-----
   #!/bin/sh
   # value after "-net" is the subnet behind the remote peer
   route add -net 192.168.4.0 netmask 255.255.255.0 dev br0
   #----- end ------
   Create a configuration file named B-tap0-br.conf and an executable script file named
   B-tap0-br.sh on OpenVPN B.
   # point to the peer
   remote 192.168.8.173
   dev tap0
   secret /etc/openvpn/secrouter.key
   cipher DES-EDE3-CBC
   auth MD5
   tun-mtu 1500
   tun-mtu-extra 64
   ping 40
   up /etc/openvpn/B-tap0-br.sh
   #-----
             ----- Start-----
                                                        _____
   #!/bin/sh
   # value after "-net" is the subnet behind the remote peer
   route add -net 192.168.2.0 netmask 255.255.255.0 dev br0
   #----- end -----
                                                      . . . . . . . . . . . . . . . .
```

**Note:** Select cipher and authentication algorithms by specifying "cipher" and "auth". To see with algorithms are available, type:

# openvpn --show-ciphers
# openvpn --show-auths

4. Start both of OpenVPN peers,

```
# openvpn --config A-tap0-br.conf&
# openvpn --config B-tap0-br.conf&
```

If you see the line "Peer Connection Initiated with 192.168.8.173:5000" on each machine, the connection between OpenVPN machines has been established successfully on UDP port 5000.

5. On each OpenVPN machine, check the routing table by typing the command:

# route

Destination	Gateway	Genmsk	Flags	Metric	Ref	Use	Iface
192.168.4.0	*	255.255.255.0	U	0	0	0	br0
192.168.2.0	*	255.255.255.0	U	0	0	0	br0
192.168.8.0	*	255.255.255.0	U	0	0	0	eth0

Interface **eth1** is connected to the bridging interface **br0**, to which device **tap0** also connects, whereas the virtual device **tun** sits on top of **tap0**. This ensures that all traffic from internal networks connected to interface **eth1** that come to this bridge write to the TAP/TUN device that the OpenVPN program monitors. Once the OpenVPN program detects traffic on the virtual device, it sends the traffic to its peer.

6. To create an indirect connection to Host B from Host A, you need to add the following routing item:

route add -net 192.168.4.0 netmask 255.255.255.0 dev eth0

To create an indirect connection to Host A from Host B, you need to add the following routing item:

route add -net 192.168.2.0 netmask 255.255.255.0 dev eth0

Now ping Host B from Host A by typing:

ping 192.168.4.174

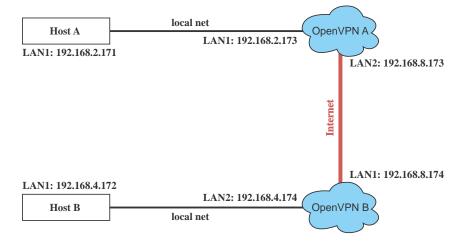

A successful ping indicates that you have created a VPN system that only allows authorized users from one internal network to access users at the remote site. For this system, all data is transmitted by UDP packets on port 5000 between OpenVPN peers.

7. To shut down OpenVPN programs, type the command:

# killall -TERM openvpn

### Setup 2: Ethernet Bridging for Private Networks on the Same Subnet

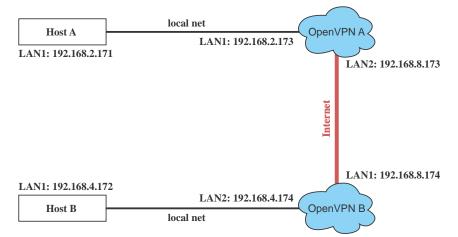

1. Set up four machines as shown in the following diagram:

 The configuration procedure is almost the same as for the previous example. The only difference is that you will need to comment out the parameter "up" in "/etc/openvpn/A-tap0-br.conf" and "/etc/openvpn/B-tap0-br.conf".

### Setup 3: Routed IP

1. Set up four machines as shown in the following diagram:

2. Create a configuration file named "A-tun.conf" and an executable script file named "A-tun.sh".

```
#!/bin/sh
# value after "-net" is the subnet behind the remote peer
route add -net 192.168.4.0 netmask 255.255.255.0 gw $5
#------ end ------
```

Create a configuration file named **B-tun.conf** and an executable script file named **B-tun.sh** on OpenVPN B:

Note that the parameter "ifconfig" defines the first argument as the local internal interface and the second argument as the internal interface at the remote peer.

Note that **\$5** is the argument that the OpenVPN program passes to the script file. Its value is the second argument of **ifconfig** in the configuration file.

3. Check the routing table after you run the OpenVPN programs, by typing the command:

Destination	Gateway	Genmsk	Flags	Metric	Ref	Use	Iface
192.168.4.174	*	255.255.255.255	UH	0	0	0	tun0
192.168.4.0	192.168.4.174	255.255.255.0	UG	0	0	0	tun0
192.168.2.0	*	255.255.255.0	U	0	0	0	eth1
192.168.8.0	*	255.255.255.0	U	0	0	0	eth0

# route

5

## Application Development with Linux Tool Chain

This chapter describes how to install the Linux tool chain, which contains a suite of cross compilers and other tools, as well as the libraries and header files that are necessary to compile your applications. The tool chain components must be installed on a host computer (PC) running Linux.

We have confirmed that the following Linux distributions can be used to install the tool chain: **Fefora core 1 & 2.** 

The following functions are covered in this chapter:

- **General Steps for Installing the Linux Tool Chain**
- **Compilation for Applications**
- **On-Line Debugging with GDB**

### Steps for Installing the Linux Tool Chain

The tool chain needs about 485 MB of hard disk space. To install it, follow these steps:

- Insert the package CD into your PC and then issue the following commands: #mount /dev/cdrom /mnt/cdrom
   #sh /mnt/cdrom/tool-chain/linux/install.sh
- 2. Wait for the installation process to complete. This should take a few minutes.
- 3. Add the directory **/usr/local/arm-linux/bin** to your path. You can do this for the current login by issuing the following command:

#export PATH="/usr/local/arm-linux/bin:\$PATH"

Alternatively, you can add the same commands to **\$HOME/.bash\_profile** to make so that the command will be executed for all login sessions.

### **Compilation for Applications**

To compile a simple C application, use the cross compiler instead of the regular compiler:

```
#arm-linux-gcc -o example -Wall -g -O2 example.c
#arm-linux-strip -s example
#arm-linux-gcc -ggdb -o example-debug example.c
```

Most of the cross compiler tools are the same as their native compiler counterparts, but with an additional prefix that specifies the target system. In the case of x86 environments, the prefix is **i386-linux-** and in the case of UC-7112-LX Plus ARM boards, it is **arm-linux-**.

For example, the native C compiler is gcc and the cross C compiler for ARM in the UC-7112-LX Plus is arm-linux-gcc.

ar	Manages archives (static libraries)		
as	Assembler		
c++, g++	C++ compiler		
cpp	C preprocessor		
gcc	C compiler		
gdb	Debugger		
ld	Linker		
nm	Lists symbols from object files		
objcopy	Copies and translates object files		
objdump	Displays information about object files		
ranlib	Generates indexes to archives (static libraries)		
readelf	Displays information about ELF files		
size	Lists object file section sizes		
strings	Prints strings of printable characters from files (usually object files)		
strip	Removes symbols and sections from object files (usually debugging information)		

The following cross compiler tools are provided:

### **On-Line Debugging with GDB**

The tool chain also provides an on-line debugging mechanism to help you develop your program. Before performing a debugging session, add the option -ggdb to compile the program. A debugging session runs on a client-server architecture on which the server gdbserver is installed in the targe computer and the client ddd is installed in the host computer. We'll assume that you have uploaded a program named hello-debug to the target computer and strat to debug the program.

1. Log on to the target computer and run the debugging server program.

#gdbserver 192.168.4.142:2000 hello-debug
Process hello-debug created; pid=38

The debugging server listens for connections at network port 2000 from the network interface 192.168.4.142. The name of the program to be debugged follows these parameters. For a program requiring arguments, add the arguments after the program name.

- On the host computer, change the directory to where the program source resides. cd /my\_work\_directory/myfilesystem/testprograms
- 3. Execute the client program.

#ddd --debugger arm-linux-gdb hello-debug &

4. Enter the following command at the GDB, DDD command prompt.

Target remote 192.168.4.99:2000

The command produces a line of output on the target console, similar to the following. Remote debugging using 192.168.4.99:2000

192.168.4.99 is the machine's IP address, and 2000 is the port number. You can now begin debugging in the host environment using the interface provided by DDD.

- 5. Set a break point on main by double clicking, or by entering b main on the command line.
- 6. Click the **cont** button.

# **6** Programmer's Guide

This chapter includes important information for programmers.

The following functions are covered in this chapter:

- □ Flash Memory Map
- **Device** API
- **RTC (Real Time Clock)**
- Buzzer
- **WDT** (Watch Dog Timer)
- **UART**

### Flash Memory Map

Partition sizes are hard coded into the kernel binary. To change the partition sizes, you will need to rebuild the kernel. The flash memory map is shown in the following table.

Address	Size	Contents
0x0000000 - 0x0003FFFF	256 KB	Boot Loader—Read ONLY
0x00040000 - 0x001FFFFF	1.8 MB	Kernel object code—Read ONLY
0x00200000 - 0x009FFFFF	8 MB	Root file system (JFFS2) —Read ONLY
0x00A00000 - 0x00FFFFFF	6 MB	User directory (JFFS2) —Read/Write

**NOTE** To improve system performance, we strongly recommend that you install your application programs on the on-board flash. However, since the on-board flash has a fixed amount of free memory space, you must not over-write it, and instead use an external storage card, such as an SD or CF card, for the data log.

### **Device API**

The UC-7112-LX Plus supports control devices with the **ioctl** system API. You will need to **include** <moxadevice.h>, and use the following **ioctl** function.

Use the desktop Linux's man page for detailed documentation:

#man ioctl

### **RTC (Real Time Clock)**

The device node is located at /dev/rtc. The UC-7112-LX Plus supports Linux standard simple RTC control. You must include <linux/rtc.h>.

- Function: RTC\_RD\_TIME
  int ioctl(fd, RTC\_RD\_TIME, struct rtc\_time \*time);
  Description: read time information from RTC. It will return the value on argument 3.
- Function: RTC\_SET\_TIME
   int ioctl(fd, RTC\_SET\_TIME, struct rtc\_time \*time);
   Description: set RTC time. Argument 3 will be passed to RTC.

### Buzzer

The device node is located at /dev/console. The UC-7112-LX Plus supports Linux standard buzzer control, with The UC-7112-LX Plus's buzzer running at a fixed frequency of 100 Hz. You must include <sys/kd.h>.

Function: KDMKTONE

ioctl(fd, KDMKTONE, unsigned int arg);

Description: The buzzer's behavior is determined by the argument **arg**. The "high word" part of arg gives the length of time the buzzer will sound, and the "low word" part gives the frequency.

The buzzer's on / off behavior is controlled by software. If you call the "ioctl" function, you MUST set the frequency at 100 Hz. If you use a different frequency, the system could crash.

### WDT (Watch Dog Timer)

### 1. Introduction

The WDT works like a watch dog function. You can enable it or disable it. When the user enables WDT but the application does not acknowledge it, the system will reboot. You can set the ack time from a minimum of 50 msec to a maximum of 60 seconds.

### 2. How the WDT works

The sWatchDog is disabled when the system boots up. The user application can also enable ack. When the user does not ack, it will let the system reboot.

Kernel boot

.... User application running and enable user ack ....

### 3. The user API

The user application must include <moxadevic.h>, and link moxalib.a. A makefile example is shown below:

all: arm-linux-gcc -o xxxx xxxx.c -lmoxalib

int swtd\_open(void)

### Description

Open the file handle to control the sWatchDog. If you want to do something, you must first open and save the file handle before doing anything else.

Input

None

#### Output

The return value is the file handle. If there is an error, it will return a value of < 0.

Use errno() to get the error number.

int swtd\_enable(int fd, unsigned long time)

#### Description

Enable application sWatchDog. You must issue the ack command after this process.

### Input

int fd - the file handle, from the swtd\_open() return value.

unsigned long time - The time you wish to ack sWatchDog periodically. You must ack the sWatchDog before timeout. If you do not ack, the system will be reboot automatically. The minimal time is 50 msec, the maximum time is 60 seconds. The time unit is msec.

#### Output

errno() returns the error code. A value of 0 (zero) indicates no error.

int swtd\_disable(int fd)

### Description

Disable the application to ack sWatchDog. In this case, the kernel will be auto ack, so the user does not need ack periodically.

#### Input

int fd - the file handle from swtd\_open() return value.

### Output

errno() returns the error code. A value of 0 (zero) indicates no error.

int swtd\_get(int fd, int \*mode, unsigned long \*time)

#### Description

Get current setting values.

mode -

1 for user application to enable sWatchDog: need to ack. 0 for user application to disable sWatchdog: does not need to ack.

time – The time period to ack sWatchDog.

#### Input :

int fd - the file handle from swtd\_open() return value.

int \*mode - this function returns the status of enable or disable (if status is "enable" the user must ack before the current time period expires.

unsigned long \*time - the function will return the current time period.

#### **Output:**

A value of 0 (zero) indicates no error.

Otherwise, you can get the error code from the function errno().

int swtd\_ack(int fd)

### Description

Acknowledge sWatchDog. When the user application enable sWatchDog, it needs to call this function periodically, using the the time predefined by the user in the application program.

### Input

int fd - the file handle from swtd\_open() return value.

### Output

A value of 0 (zero) indicates no error.

Otherwise, you can get the error code from the function errno().

int swtd\_close(int fd)

### Description

Close the file handle.

#### Input

int fd - the file handle from swtd\_open() return value.

### Output

A value of 0 (zero) indicates no error.

Otherwise, you can get the error code from the function errno().

### 4. Special Note

When you "kill the application with -9" or "kill without option" or "Ctrl+c" the kernel will change to auto ack the sWatchDog.

When your application enables the sWatchDog and does not ack, your application may have a logical error, or your application has made a core dump. The kernel will not change to auto ack. This can cause a serious problem, causing your system to reboot again and again.

### 5. User application example

#### **Example 1:**

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <moxadevice.h>
int main(int argc, char *argv[])
Ł
 int fd;
 fd = swtd_open();
 if ( fd < 0 ) {
  printf("Open sWatchDog device fail !\n");
  exit(1);
 }
 swtd_enable(fd, 5000);// enable it and set it 5 seconds
 while ( 1 ) {
  // do user application want to do
  .....
  swtd_ack(fd);
  .....
  ···· •
 }
 swtd_close(fd);
 exit(0);
}
```

The makefile is shown below:

```
all:
arm-linux-gcc -o xxxx xxxx.c -lmoxalib
```

### Example 2:

```
#include <stdio.h>
#include <stdlib.h>
#include <signal.h>
#include <signal.h>
#include <sys/stat.h>
#include <sys/stat.h>
#include <sys/select.h>
#include <sys/time.h>
#include <moxadevice.h>
static void mydelay(unsigned long msec)
{
   struct timeval time;
```

```
time.tv_sec = msec / 1000;
 time.tv_usec = (msec % 1000) * 1000;
 select(1, NULL, NULL, NULL, &time);
}
static int swtdfd;
static int stopflag=0;
static void stop_swatchdog()
{
 stopflag = 1;
}
static void do_swatchdog(void)
{
 swtd_enable(swtdfd, 500);
 while ( stopflag == 0 ) {
 mydelay(250);
  swtd_ack(swtdfd);
 }
 swtd_disable(swtdfd);
}
int main(int argc, char *argv[])
{
 pid_t sonpid;
 signal(SIGUSR1, stop_swatchdog);
 swtdfd = swtd_open();
 if ( swtdfd < 0 ) {
 printf("Open sWatchDog device fail !\n");
  exit(1);
 }
 if ( (sonpid=fork()) == 0 )
 do_swatchdog();
 // do user application main function
 ..........
 // end user application
kill(sonpid, SIGUSR1);
 swtd_close(swtdfd);
 exit(1);
}
The makefile is shown below:
all:
 arm-linux-gcc -o xxxx xxxx.c -lmoxalib
```

### UART

The normal tty device node is located at /dev/ttyM0 ... ttyM1.

The UC-7112-LX Plus supports Linux standard termios control. The Moxa UART Device API allows you to configure ttyM0 to ttyM1 as RS-232, RS-422, 4-wire RS-485, or 2-wire RS-485. UC-7112-LX Plus supports RS-232, RS-422, 2-wire RS-485, and 4-wire RS485.

You must include <moxadevice.h>.

```
#define RS232_MODE 0
#define RS485_2WIRE_MODE 1
#define RS422_MODE 2
#define RS485_4WIRE_MODE 3
```

1. Function: MOXA\_SET\_OP\_MODE

int ioctl(fd, MOXA\_SET\_OP\_MODE, &mode)

Description

Set the interface mode. Argument 3 mode will pass to the UART device driver and change it.

2. Function: MOXA\_GET\_OP\_MODE

int ioctl(fd, MOXA\_GET\_OP\_MODE, &mode)

Description

Get the interface mode. Argument 3 mode will return the interface mode.

There are two Moxa private ioctl commands for setting up special baudrates.

Function: MOXA\_SET\_SPECIAL\_BAUD\_RATE Function: MOXA\_GET\_SPECIAL\_BAUD\_RATE

If you use this ioctl to set a special baudrate, the termios cflag will be B4000000, in which case the B4000000 definition will be different. If the baudrate you get from termios (or from calling tcgetattr()) is B4000000, you must call ioctl with MOXA\_GET\_SPECIAL\_BAUD\_RATE to get the actual baudrate.

### Example to set the baudrate

```
#include <moxadevice.h>
#include <termios.h>
struct termios term;
int fd, speed;
fd = open("/dev/ttyM0", O_RDWR);
tcgetattr(fd, &term);
term.c_cflag &= ~(CBAUD | CBAUDEX);
term.c_cflag |= B4000000;
tcsetattr(fd, TCSANOW, &term);
speed = 500000;
ioctl(fd, MOXA_SET_SPECIAL_BAUD_RATE, &speed);
```

### Example to get the baudrate

```
#include <moxadevice.h>
#include <termios.h>
struct termios term;
int fd, speed;
fd = open("/dev/ttyM0", O_RDWR);
tcgetattr(fd, &term);
if ( (term.c_cflag & (CBAUD|CBAUDEX)) != B4000000 ) {
    // follow the standard termios baud rate define
} else {
    ioctl(fd, MOXA_GET_SPECIAL_BAUD_RATE, &speed);
}
```

### **Baudrate inaccuracy**

Divisor = 921600/Target Baud Rate. (Only Integer part) ENUM = 8 \* (921600/Targer - Divisor) ( Round up or down) Inaccuracy = (Target Baud Rate – 921600/(Divisor + (ENUM/8))) \* 100% E.g., To calculate 500000 bps Divisor = 1, ENUM = 7, Inaccuracy = 1.7% \*The Inaccuracy should less than 2% for work reliably.

### **Special Note**

- 1. If the target baudrate is not a special baudrate (e.g. 50, 75, 110, 134, 150, 200, 300, 600, 1200, 1800, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400, 460800, 921600), the termios cflag will be set to the same flag.
- 2. If you use stty to get the serial information, you will get speed equal to 0.

# 7 Software Lock

"Software Lock" is an innovative technology developed by the Moxa engineering team. It can be adopted by a system integrator or developer to protect applications from being copied. An application is compiled into a binary format bound to the embedded computer and the operating system (OS) that the application runs on. As long as one obtains it from the computer, he/she can install it on the same hardware and the same operating system. In this case, the add-on value created by the developer will be lost.

Moxa's engineers used data encryption to develop this protection mechanism for your applications. The binary file associated with each of your applications needs to undergo an additional encryption process after you have developed it. The process requires you to install an encryption key in the target computer.

1. Choose an encryption key (e.g.,"ABigKey") and install it in the target computer by a preutility program, 'setkey'.

### #setkey ABigKey

#### Note: set an empty string to clear the encryption key in the target computer by:

#setkey ""

- 2. Develop and compile your program in the development PC.
- 3. In the development PC, run the utility program 'binencryptor' to encrypt your program with an encryption key.

### #binencryptor yourProgram ABigKey

4. Upload the encrypted program file to the target computerby FTP or NFS and test the program.

The encryption key is a computer-wise key. That is to say, a computer has only one key installed. Running the program 'setkey' multiple times overrides the existing key.

To prove the effectiveness of this software protection mechanism, prepare a target computer that has not been installed with an encryption key or install a key different from that used to encrypt your program. In either case, the encrypted program should fail immediately.

This mechanism also allows computers with an encryption key to bypass programs that are not encrypted. Therefore, in the development phase, you can develop your programs and test them in the target computer cleanly.

A

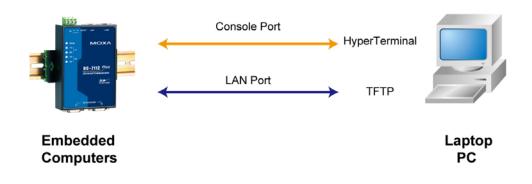

## Boot Loader Utility for Firmware Upgrade or Recovery

Moxa provides a boot loader utility for firmware upgrade or recovery. You will need the following items to use this utility.

- 1. The embedded computer whose firmware you would like to upgrade or recover.
- 2. A PC or a laptop computer.
- 3. A console port cable for connecting through HyperTerminal.
- 4. A cross-over Ethernet cable for upgrading the firmware through a TFTP server and LAN port.
- 5. The firmware for the embedded computer.

Target Site

### **Server Site**

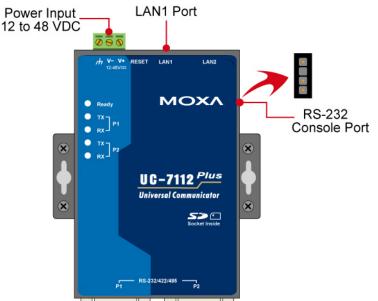

The recovery includes four steps.

- A. Configure HyperTerminal for the console port.
- B. Check if your embedded computer supports the boot loader utility.
- C. Download and install the TFTP program.
- D. Download the firmware and upgrade through HyperTerminal.

If you are familiar with Moxa's embedded computers and the firmware upgrade procedure, you may skip to Step D. However, we suggest that you follow all procedures to ensure that each step is correct.

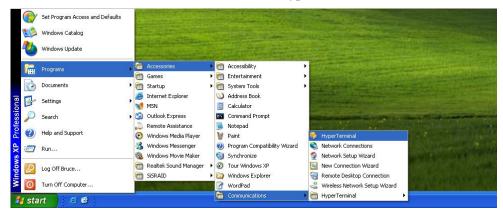

### A. Configure HyperTerminal for the Console Port.

- 1. Connect your embedded computer to a power source.
- 2. Connect the console port of the UC-7112-LX Plus Series embedded computer to your PC using a console port cable. The power input is located on the top panel, and the console port is located on the side panel of the UC-7112-LX Plus. See the following figure for details.

### UC-7112-LX Plus Series Front View

3. Launch a serial communication tool to access your embedded computer. We suggest that you use HyperTerminal, which is built into Windows XP. Click Start → Programs → Accessories → Communications and then select HyperTerminal.

4. After HyperTerminal launches, enter a name for the connection.

Connection Description
New Connection
Enter a name and choose an icon for the connection:

#### B. Check if Your Embedded Computer Supports the Boot Loader Utility

1. Power on the embedded computer. If the following information appears on the HyperTerminal screen, it means that you can use the boot loader utility to upgrade or recover the firmware.

🗞 UC-7112 Plus - HyperTerminal	
Elle Edit View Call Iransfer Help	
PRESS <del> FOR SYSTEM RECOVERY</del>

- Command>>\_
- 3. If you do not see the boot loader utility menu, your embedded computer does not support the boot loader utility. Contact Moxa's technical support staff for assistance.

# C. Download and install the TFTP program.

1. You will need to download a free TFTP server package to upgrade the firmware for the boot loader utility. Link to the following URL to download:

#### ftp://papa.indstate.edu/

Download the TFTP program located in the following path. /winsock-1/Windows95/Daemons/TFTPD/

Download the file named tftpd32d.zip.

2. When you finish downloading, extract the files to your PC.

☐ O Use the following IP address	8:
<u>I</u> P address:	192.168.1.1
S <u>u</u> bnet mask:	255 . 255 . 255 . 0
Default gateway:	
O Obtain DNS server address	automatically
• Use the following DNS serve	er addresses:
Preferred DNS server:	
<u>A</u> lternate DNS server:	· · · ·
	Ad <u>v</u> anced
	OK Cancel

8. Go back to the boot load utility menu and enter the local IP address. This local IP address is the IP address of the embedded computer. Note that the local IP address must be on the same network as the server IP address. For example, if the server IP address is 192.168.1.1, you can choose a local IP address from the range 192.168.1.2 to 192.168.1.255.

( 1) Change IP Setting	( 2) Show Current IP Setting
Command>>1 Local IP Address : 192.168.1.2 Server IP Address : 192.168.1. Programming flashrom 0x8000000 Check Data (0x20000) OK!	1
Config initialOK !	
Local IP : 192.168.1.2 Server IP : 192.168.1.1	
Moxa Technologies Co., Ltd V Module Name : UC-7112-LX-Plu MACO : 00:90:e8:00:d0:d1 MF	ıs (MOXART) Serial No. : 0

9. After you finish the IP Setting, select [2] Show Current IP Setting to make sure the IP addresses are correct.

17. If you cannot reboot your embedded computer, contact Moxa's technical support staff for assistance.

# System Commands

# Linux normal command utility collection

# File manager

1. ср	copy file
2. ls	list file
3. In	make symbolic link file
4. mount	mount and check file system
5. rm	delete file
6. chmod	change file owner & group & user
7. chown	change file owner
8. chgrp	change file group
9. sync	sync file system, let system file buffer be saved to hardware
10. mv	move file
11. pwd	display now file directly
12. df	list now file system space
13. mkdir	make new directory
14. rmdir	delete directory
1. vi	text editor

# Editor

1.	vi	text editor
2.	cat	dump file context
3.	zcat	compress or expand files
4.	grep	search string on file
5.	cut	get string on file
6.	find	find file where are there
7.	more	dump file by one page
8.	test	test file exist or not
9.	sleep	sleep (seconds)
10.	echo	echo string

# Network

1.	ping	ping to test network
2.	route	routing table manager
3.	netstat	display network status

- 3. netstatdisplay network status4. ifconfigset network ip address
- 5. tftp
- 6. telnet
- 7. ftp

# Process

1.	kill	kill process
2.	ps	display now running process

### Other

1.	dmesg	dump kernel log message
2.	sty	to set serial port
3.	zcat	dump .gz file context
4.	mknod	make device node
5.	free	display system memory usage
6.	date	print or set the system date and time
7.	env	run a program in a modified environment
8.	clear	clear the terminal screen
9.	reboot	reboot / power off/on the server
10.	halt	halt the server
11.	du	estimate file space usage
12.	gzip, gunzip	compress or expand files
13.	hostname	show system's host name

# Moxa special utilities

1.	kversion	show kernel version
2.	cat /etc/version	show user directory version
3.	upramdisk	mount ramdisk
4.	downramdisk	unmount ramdisk
